Review of Trends in the
Revenues and Expenditures
of Provincial Governments
over the Past Five Years

CANADIAN STATISTICAL REVIEW

Cette revue est disponible en édition française, Revue Statistique du Canada, n° du catalogue 11-003F.

Series published in this Review are stored in CANSIM, the computerized time series data bank of the Dominion Bureau of Statistics. All or any part of the data bank contents may be purchased on magnetic tape or as computer printouts. For additional information, see inside back cover.

Selected Economic Indicators appearing in the Section 1 are published in seasonally adjusted form. Seasonally adjusted data are most useful for analysis and forecasting as they bring out the underlying trends of economic time series. Seasonal adjustments remove the effect of repetitive intra-year variations resulting from normal differences in weather, holidays with invariable dates, or other events which repeat with the same timing. Additional adjustments may be necessary for series which contain variation due to the difference in working or trading-days in each month or for holidays or other events with variable dates. Such adjustments are made prior to the seasonal adjustment but are treated as part of the seasonal adjustment.

The seasonal adjustment method applied to economic time series at the Dominion Bureau of Statistics is a computerized ratio-to-moving average method. The standard computer program used in the Bureau is the US Bureau of the Census Method II. The X-9 version is used for Labour Force data; for other data adjusted by computer the X-11 version is used.

The *MCD*, or *Months for Cyclical Dominance*, in a table containing seasonally adjusted series indicates the smallest span of months for which the average change in the cyclical factor is greater than that in the irregular factor. For the smoothest series the MCD is 1, for the most erratic series it is 6. Applying moving average of the period equal to the MCD tends to smooth irregular movements which may obscure the underlying trend-cycle.

Smoothed data have been used for the graphs of some of the seasonally adjusted series with MCD of 4, 5 or 6. A 5-term moving average was applied for smoothing these series.

* * * * *

A weekly supplement containing data published between release dates of this review is distributed free of charge to all subscribers. Historical data for *Selected Economic Indicators*, both unadjusted and adjusted for seasonal variation, are distributed to subscribers in an Annual Supplement.

SYMBOLS

The following standard symbols are used in this and other DBS publications:

- .. figures not available
- ... figures not appropriate or not applicable
- nil or zero.
- amount too small to be expressed
- † advance estimates.
- p preliminary figures.
- r revised figures.
- x confidential to meet secrecy requirements of the Statistics Act.

MCD months for cyclical dominance (see above).

NOTE TO USERS

Changes occur from time to time in tables contained in this Review to reflect newly available economic series, changes made in concept, composition, comparability, seasonal adjustment methods, benchmark data, etc. Changes in this issue are as follows:

Section 10, Table 1—Retail Trade

October 1970 figures (raw) are based on 1966 Census and therefore not comparable to previous months.

October 1970 figures (seasonally adjusted) were derived using seasonal factors obtained from the revised retail trade data. Historical revisions to both raw and seasonally adjusted data will appear in the February issue of the Review.

Section 10, Table 6—Consumer Credit

Unadjusted data have been revised back to January 1969. Seasonally adjusted data are revised for 1970 only.

The series "Sales Finance Companies" and "Consumer Loan Companies" have been combined under "Instalment Financing" commencing with January 1970 data.

REVIEW OF TRENDS IN THE REVENUES AND EXPENDITURES OF PROVINCIAL GOVERNMENTS OVER THE PAST FIVE FISCAL YEARS

C.D.P. Bernier*

Introduction

The revenues and expenditures of provincial governments continued to expand very rapidly from 1966-67 to 1970-71,¹ far more rapidly in fact than they had during the preceding five years. This may not be entirely apparent on cursory examination of data for the past decade because the years 1961-62 to 1965-66 also witnessed an expansion of substantial proportion in the size of provincial budgets. However, the early sixties were years of dramatic realignment in federal-provincial fiscal arrangements during which a number of consecutive shifts in the occupancy of certain tax fields steadily took away from the federal government and gave to the provinces. Thus, although this earlier period saw a rapid increase of provincial revenues, an increase that was much needed to keep in step with fast growing provincial expenditures, the gain was noticeably less than that which took place during the last five years and much of it was made possible by continuous federal withdrawals from the personal and corporation income tax fields. The experience of the years 1966-67 to 1970-71 was different in that not only did provincial revenues increase at a rate which exceeded that of the preceding five years but a much smaller proportion of the increase was attributable to federal surrender of "tax points".²

What were the main reasons behind the continued acceleration of the rate of growth of provincial budgets during the past five years? On the expenditure side, one can surmise that it reflected the ever-growing concern of government and people for inequalities in the availability of services essential to promote the physical and economic welfare of the individual and a growing collective resolution to do something to reduce them. On the revenue side, it was made possible in large part by the continued resiliency of an economic upswing reaching back to 1961 which, after subsiding somewhat in 1967, regained its vigour in the latter years despite admittedly troublesome inflationary circumstances.³ The

* Mr. Bernier is Chief, Provincial Government Section, Governments Division. Prior to assuming his present duties in February 1970, Mr. Bernier was, for eleven years, with the Federal Department of Finance where he had prime responsibility for revenue forecasting and the related statistical analysis of the responses of the various revenue sources to changes in economic or demographic variables.

¹ The 1970-71 data used in this analysis is estimated. It was put together for purposes of DBS, *Provincial Government Finance - Revenue and Expenditure (Estimates)* (Catalogue No. 68-205) from provincial government budget speeches and estimates as well as from certain information on unconditional transfer payments to the provinces obtained from federal sources.

² "Tax points" refers to the percentage points of federal "basic tax" on personal income or of federal tax rates applicable to corporation profits that were released to the provinces under the present Federal-Provincial Fiscal Arrangements.

³ The pace of economic expansion has, however, slowed down markedly in the first half of 1970.

economic buoyancy of the late sixties made it possible for provincial government revenues to keep growing at an accelerated rate quite independently of tax increases or the availability of additional "tax points". Still, tax increases had to be made to keep the growth of revenues within range of the very considerable increase in expenditures brought about by the ever-expanding involvement of government in the provision of additional services.

The analysis which follows focuses on the broad components of provincial budgets. It examines trends for the yields of the main levies on income, transactions and other taxation bases, for non-tax receipts from own sources,⁴ and for transfers from other levels of government. Similarly it reviews trends in expenditures for general government, education, health, welfare, transport and communications, debt charges and unconditional transfers to other levels of government. Having presented an all-province summary of developments pertaining to these revenue sources and expenditure functions, it then proceeds to a comparison of the various provincial experiences.

The approach used is to establish changes in absolute and percentage terms for the yields of the main revenue sources and for outlays under the main expenditure functions over the period 1966-67 to 1970-71. This provides an overview of trends at the global level and makes it possible to come to some appraisal of secular shifts in the composition of provincial government budgets. For a more complete analysis, trends pertaining to per capita changes are also examined. Global changes provide a general picture but they do not distinguish between changes due to population increase and changes attributable to the higher (natural or compelled) productivity of revenue sources or the higher level of services provided under the various expenditure functions. Per capita changes, on the other hand, by relating specifically to the individual, discount population increase and provide a more meaningful measure of the variations in revenue productivity or spending propensity. The per capita approach is especially useful for interprovincial comparison because it is the only way of assessing truly corresponding trends in revenue-raising effort or success and in expenditure orientation among the provinces.

The data used in the analysis is in current dollars. The contribution of price increase to the expansion of provincial budgets is not isolated. Separate examination of the phenomenon is not possible because of the unavailability of pertinent deflators. Suffice it to say that both revenues and expenditures are affected. Government derives more

⁴ Residual category which includes revenues other than revenues from taxation, liquor profits or transfers from other levels of government.

revenue from personal income tax, corporation income tax, sales tax etc. as a result of the increases in personal and corporation income that generate higher prices. Conversely it has to pay more for the goods and services that it requires. The period 1966-67 to 1970-71 was beset by inflationary pressures that played a significant part in the expansion of provincial budgets.

Revenues

Table 1 shows that the growth of provincial revenues from 1966-67 to 1970-71 came to 88.9 per cent on a global basis and 80.1 per cent on a per capita basis. In terms of average annual rates, these gains work out to 17.2 per cent and 15.8 per cent respectively. Even if the Gross National Product experienced an above average rate of increase during this period (slightly over 8.0 per cent), the expansion of provincial revenues was truly exceptional. The sources which, proportionately to the size of their yield at the beginning of the period, contributed most noticeably to this advance were personal income tax, general sales tax, the residual called "other provincial taxes", non-tax receipts from own sources, and conditional and unconditional transfers from other levels of government. The contributions of the other sources, when consideration is given to all variables affecting their yield, was also noteworthy although less evident.

The provincial revenue from personal income tax showed great buoyancy during the period of observation. This is not surprising considering the high income elasticity of the levy for these years (in the vicinity of 2).⁵ However, there is more to

⁵ Conclusion reached from statistical analysis of this relationship. The high income elasticity of the personal income tax results from the existence of "basic exemptions" and graduated rates of tax.

explain the sharp increase in the yield of this source. In 1967, the provinces gained additional "basic tax" points (4 for all provinces other than Quebec and 3 for Quebec). In addition six provinces⁶ increased the rate of their levy. All these factors combined to more than double the per capita yield of the tax, raising it from \$56 in 1966-67 to \$118 in 1970-71. The revenue from general sales tax also increased sharply during these years, rising from a per capita of \$50 in 1966-67 to \$83 in 1970-71. The gain was quite remarkable when one considers that the personal expenditure elasticity of this impost is somewhat less than 1;⁷ in fact, it can only be explained in terms of fairly substantial tax increases in several provinces. The gain registered by the category called "other provincial tax revenues" was in large measure attributable to substantial increases in hospital insurance premiums in certain provinces (particularly in Ontario in 1969) and to the inception of medicare in provinces where the provincial share of the cost of the program was financed either almost entirely (Ontario and British Columbia) or partially (Manitoba) by premiums. The rise in tobacco tax yield and liquor profits was abnormally high when it is considered that alcohol and tobacco consumption tends to be more closely related to population than to disposable personal income. Again, rate increases contributed largely to the increment in yield. Non-tax receipts from own sources expanded rapidly during the period mainly on the strength of selective increases in charges for privileges, licenses and permits and also because of the accelerated growth of interest receipts following the sharp upward climb of interest rates from late 1967 to mid-

⁶ Newfoundland, New Brunswick, Quebec, Manitoba, Saskatchewan and Alberta.

⁷ This is explained by the fact that the provincial sales taxes do not apply to most foodstuffs or services. As a result increased personal expenditure on these items does not generate tax revenue.

TABLE 1. Growth of Gross Provincial Revenues, 1966-67 to 1970-71

| Revenue source | Revenues | | | | Percentage increase 1966-67 to 1970-71 | | Average annual rate of increase | |

| Totals..... | 7,151 | 351 | 13,508 | 632 | 88.9 | 80.1 | 17.2 | 15.8 |

Sources: DBS *Provincial Government Finance - Revenue and Expenditure* (Catalogue No. 68-207) for 1966-67 and DBS *Provincial Government Finance - Revenue and Expenditure (Estimates)* Catalogue No. 68-205) for 1970-71.

1969. Unconditional transfer payments went up considerably during the period, partially as a result of an important change in the equalization formula in 1967⁸ and partially as a result of the overall large increase in provincial revenues from own sources.⁹ As for conditional transfers, their rapid growth from 1966-67 to 1970-71 was largely attributable to stepped-up federal support of certain social programs (the Canada Assistance Plan, Medicare and the Post-Secondary Education Program).

Expenditures

As one might expect, the growth in provincial expenditures paralleled that of provincial revenues between 1966-67 and 1970-71. Table 2 shows that total spending rose by 85.4 per cent on a global basis and 77.0 per cent on a per capita basis during the period. In terms of average annual rates, these gains approximate 16.7 per cent and 15.4 per cent respectively. The functions on which outlays rose most markedly were education, health, welfare, debt charges and the residual category called "other provincial expenditures". The rate of growth for an important function, transport and communications, was minimal¹⁰ while transfers to other levels of government (local governments) increased at a rate slightly above that of general economic activities.

⁸ Change which broadened the range of provincial revenues to be equalized from income taxes and succession duties only to all revenues from provincial sources.

⁹ Equalization payments are directly related to the level of aggregate provincial revenues from own sources.

¹⁰ Part of the explanation for the low increase in this area of expenditure is the fact that 1966-67 witnessed particularly heavy outlays on highways, roads and bridges in Quebec in preparation for Expo'67. Current spending on this function is lower in that province than it was in 1966-67.

Provincial government outlays for education rose from a per capita of \$102 in 1966-67 to \$197 in 1970-71. This is a vivid testimonial to the remarkable increase in allocation of resources to this area of provincial government activity in recent years. It provides an indication of the extent of the efforts made to accommodate the pressures generated by a very sharp increase in school age population at the secondary and post secondary level as well as to improve the quality of the educational services provided. Health is another area where provincial government spending forged ahead rapidly over the same period. The continuing fast increase of outlays on hospitalization and the introduction of medicare in nine provinces combined to raise the per capita outlay for this function from \$88 in 1966-67 to a very impressive \$183 in 1970-71. Welfare expenditures experienced a more subdued pattern of increase; nevertheless they grew from a per capita of \$34 in 1966-67 to \$55 in 1970-71. Full development of the Canada Assistance Plan which came into force in July, 1966 accounted for a large proportion of increased spending in this area.¹¹ The rapid increase in amounts required to service provincial indebtedness (from \$16 to \$35 per capita) resulted in part from the attendant steep rise in interest rates, a rise which increased by more than 50 per cent the price paid by the provinces for their borrowed funds, and in part from a significant increase in provincial debt outstanding. Expenditures on the category "other provincial expenditures" also grew at a comparatively rapid rate during the period (rising from \$47 to \$80 per capita) but much of their expansion followed logically from the increase in outlays on the main functions of provincial expenditures.

¹¹ Between 1966-67 and 1967-68 alone, expenditures on this function increased from \$698 million to \$883 million.

TABLE 2. Growth of Gross Provincial Expenditures, 1966-67 to 1970-71

| Expenditure function | Expenditures | | | | Percentage increase 1966 - 67 to 1970 - 71 | | Average annual rate of increase | |

¹The effect of the delay in the receipt of customs import documents has been adjusted for the period April 1966- July 1967 for total imports, total trade with the United States, the United Kingdom and Other Countries.

SELECTED MONTHLY SERIES (More detail in Sections 6; 10; 12; 13; respective Tables 1; 6; 1; 4 & 12.)

MANUFACTURING, SHIPMENTS, INVENTORIES AND ORDERS WERE GENERALLY SLIGHTLY LOWER IN OCTOBER.
RAIL REVENUE FREIGHT LOADED INCREASED BY 2.4 PER CENT.
CHEQUES CASHED SHOWED A DECLINE OF 1.3 PER CENT.

¹The occupational status of the majority of the persons destined to the labour force is determined by immigration officials by an examination of documentary evidence provided by the immigrants. The classification of occupations is similar to that used in the 1961 Census; see Occupational Classification Manual, Census of Canada, 1961, Catalogue Number 12-506. ²Includes logging, fishing, trapping and hunting. ³Includes mechanical and construction. ⁴Includes a small number in non-specified occupations. ⁵Does not include students entering Canada on students' visas. ⁶Includes also retired persons, elderly dependents, fiancés or fiancées and other unspecified persons not intending to enter the labour force. ¹Excludes profits of government business enterprises. ²Includes the withholding tax applicable to this item. ³Includes profits (net of losses) of government business enterprises and other government investment income. ⁴Includes value of physical change in farm inventories. The seasonally adjusted data includes on arbitrary smoothing of crop production and standard seasonal adjustment for with-drawals of grain from farm stocks and the change in other farm-held inventories. Because of the arbitrary element, too precise an interpretation should not be given the seasonally adjusted figures. ⁵Includes net income of independent professional practitioners. ⁶See footnote 4, Table 1.2. Source: National Income and Expenditure Accounts, Third Quarter 1970 (D. B. S. 13-001).

¹Includes defence expenditures. ²Includes outlay on new durable assets such as building and highway construction by governments, other than government business enterprises. Excludes defence construction and equipment which are defined as current expenditure. ³Includes capital expenditures by private and government business enterprises, private non-commercial institutions and outlays on new residential construction by individuals. Capital expenditure is defined to include all transfer costs on the sales and purchases of the existing land and buildings. ⁴The book value of inventories is deflated to remove the effect of price changes and the derived "physical" change is then valued at average prices of the current period to obtain the value of physical change. The difference between this value of physical change and the change in book value is called the inventory valuation adjustment. (as shown in Table 1.1) ⁵See footnote 4, Table 1.1. Source: National Income and Expenditure Accounts, Third Quarter 1970 (D. B. S. 13-001).

¹The implicit price deflators of the seasonally unadjusted components of Gross National Expenditure, derived by dividing the value figures in current dollars by the constant dollar figures, are not suitable as indicators of quarter-to-quarter price change. This is because they are currently weighted and therefore are affected by compositional shifts which occur within the unadjusted components of Gross National Expenditure, on a quarter-to-quarter basis. Quarter-to-quarter movements in the implicit price deflators based on seasonally adjusted data are less subject to the problem of shifting weights and may be used as a measure of price change.

¹Includes the newly imposed taxes on life insurance companies. At the present time, for National Accounts purposes, life insurance companies are treated as associations of individuals in so far as their investment activities are concerned. The new taxes are thus included here pending a complete review of the treatment of insurance.

²Excludes the refundable tax on corporate cash profits introduced May 1966. Refunding of the tax began in the third quarter 1968. ³Withholding taxes. ⁴The quarterly figures of real property taxes unadjusted and seasonally adjusted are obtained by dividing annual totals by four since real property tax rates have been generally upward, this treatment gives rise to a fictitious seasonal between the fourth and first quarters in the seasonally adjusted taxes of series.

¹These implicit indexes are currently weighted price indexes. They reflect not only pure price changes, but also changing expenditure patterns within and between major groups. Quarter-to-quarter comparisons based on the seasonally adjusted Doto are less subject to the problem of shifting weights than are similar comparisons based on data unadjusted for seasonality, and therefore may be used as indicators of price change.

Table 1.9: relation between gross national product at market prices and gross domestic product at factor cost, (million dollars)

¹A minus sign except for official monetary movements, indicates an outflow of capital from Canada. ²Includes guaranteed issues. ³Bank balances and other short-term funds abroad (excluding official reserves).⁴Includes changes in loans and accounts receivable and payable, and also balancing item representing difference between direct measurements of current and capital accounts. ⁵Canada's Special Drawing Rights are shown for the first quarter 1970. SDR's were issued January 1, 1970 by the International Monetary Fund (IMF) to member countries participating in the agreement.

¹Excludes inmates of institutions, members of the armed services, Indians living on reserves and residents of the Yukon and Northwest Territories. The estimates are derived from a sample survey and are subject to sampling error. In general, the smaller the estimate, the larger is the relative sampling error. ²The labour force as a percentage of the population 14 years of age and over. ³The unemployed as a percentage of the labour force. ¹In calculating time loss, only the workers directly affected by the strike or lockout are taken into account; time lost by workers indirectly affected, such as those laid off as a result of a work stoppage is not included. ²The statistics for individual industries exclude strikes and lockouts involving fewer than 100 workers; the total, however, includes all work stoppages. The agricultural, finance, insurance and real estate and public administration and defence industries are not shown separately; should strikes occur in these industries, they also will be shown in the total. ³Includes miscellaneous manufacturing industries. ⁴Includes also publishing and allied industries. ⁵Includes also the storage and communication industries.

¹The data in Tables 12 to 19 are based on reports from firms employing 20 persons or more in any month of the year and relate to the last pay periods in the month. Greater industrial and area detail and more explanatory notes are given in the source publication named below. ²Excludes agriculture, fishing, trapping and public administration and defence. ³Includes storage, electric power, gas and water utilities. ⁴Excludes domestic service. Source: Employment and Average Weekly Wages and Salaries, (72-002), D. B. S.

¹Monthly shipments represent an estimated projection of the latest available Census of Manufacturers values except for those industries whose long-term contracts result in large intermittent shipments; for these a monthly estimate of work put in place has been substituted. ²Total manufacturing inventory owned by manufacturers including warehouse stocks. ³Total new orders received during the period of estimated selling value, net of cancellations, regardless of whether the orders will be filled from stock or as a result of activity during the same month. ⁴Annual figures for inventories and unfilled orders are end of December values.

¹Monthly shipments represent an estimated projection of the latest available Census of Manufacturer's values except for those industries whose long term contracts result in large intermittent shipments; for these a monthly estimate of work put in place has been estimated. Source: Inventories, Shipments and Orders in Manufacturing Industries (31-001), D.B.S.

¹Prior to January 1969 shoe classifications were different from those now in use. The change was undertaken in order to eliminate ambiguity. The discontinuity is virtually insignificant except perhaps in two classifications, i.e. girls' under size 4 and infants' and "little children's". Source: Footwear Statistics (33-002), D. B. S.

¹Data compiled according to the Steel Distribution Index revised January, 1964. Figures on net shipments relate to rolled steels products only. Shipments to consuming industries of castings, forgings and steel pipe are not included. ²Includes building contractors, public and utility construction, structural steel fabricators, national defence and public works and utilities. ³Includes appliances and utensils. Note: Some groupings are not entirely comparable to year 1964 due to change in classifications but in general the differences are minimal. ⁴Excluding shipments for re-processing of maker's own plant. ⁵Data on shipments of steel shapes to consuming industries are not available for this period (August 69 to November 69) due to the effect of strikes in this industry. ¹Production plus imports less re-exports, minus exports. ²Commencing January 1967, the value of new motor vehicles sold in Canada (as reported by manufacturers and distributors) was based on "actual cost to purchaser" rather than the suggested list price as in the past. Sources: Motor Vehicle Shipments (42-002), New Motor Vehicle Sales (63-007), Trade of Canada, Imports (65-007), Exports (65-004), D. B. S.

Note: Components may not add to totals due to rounding. Current figures in this table are preliminary and therefore subject to revision. ¹Includes crude oil, condensate and pentones plus. ²Deliveries to refineries and exports do not add to total new supply due to losses, other uses and inventory changes. ³Gross new production by field less field flared and waste. ⁴By gas utilities, does not include imports. Sources: Crude Petroleum and Natural Gas Production (26-006), Gas Utilities (55-002), D. B. S.

¹The coverage was extended to 507 municipalities in 1948, and as of 1965, stands at more than 1,400; minor revisions are still being required in the table, due to the non-receipt of returns from a few small places. No account is taken of the building activity outside of registration areas. Actual operations normally follow the granting of permits but a number of projects are not undertaken or abandoned. The amount depends upon the statement of the applicant and considerable change may develop before the completion of the operation. Source: Building Permits (64-001), D. B. S.

¹A dwelling unit is defined as a structurally separate set of living quarters having its own entrance from outside of the building, or from a common passage inside. These data are the result of a nation-wide survey, for which the field work is carried out by the Central Mortgage and Housing Corporation. All metropolitan areas and urban centres with a population of 10,000 or more, along with certain other areas of high building activity, are enumerated completely each month. The remainder of the country is covered on a sample basis quarterly. ²End of period. Source: New Residential Construction (64-002), D. B. S.

¹Cash receipts from farming operations excluding supplementary payments. Excludes Newfoundland. ²Represents participation payments made by the Canadian Wheat Board direct to producers on crops delivered in previous years. ³Includes rye, flaxseed, rapeseed, soybeans and corn. ⁴Includes clover and grass seed, hay, clover, greenhouse products, mustard seed, sunflower seed, hops, dry beans and dry peas and miscellaneous products. ⁵Made under the authority of the Agricultural Stabilization Act.

Note: Components may not add to totals due to rounding. ¹The estimates for the current year are subject to revision since the factors used in the blow-up are based on the previous years' operations and may change when the current annual totals for all firms are known the following year. ²Excluding trucks. ³The total value of all machines shown in this table is greater than the value shown for farm machinery in section 10, table 3 which covers wholesalers proper only. The above table covers all sales to users and includes sales by manufacturers through their agents as well as the sales of importers and other dealers made directly to users. Even though sales are to users, i.e. farmers, values are stated at wholesale prices, i.e. cost to dealers. Source: Farm Implement and Equipment Sales (63-009), D. B. S.

¹These indexes are available for January, April and August only. ²Average rates of cash wages paid per month to male hired help on farms. They reflect average of wages paid to all male farm help regardless of age and skill. Data available for Jan., May and Aug. only. ³Excl. of NFLD. Western grain prices used in the construction of the Index prior to Aug 1, 1967 are final. From Aug 1, 1967 to date, the western grain prices used in the Index are initial prices only for wheat, oats and barley. ⁴The number of bushels of No. 1 feed barley, or cwt of mixed feed, that equal in value 100 lbs. of Grade B live hog. Effective January 1969, equal in value to 100 lbs. of Index 100 live hog. ⁵Price of 100 lbs. good steer as a % of the price of 100 lbs. live hog, Grade B, or good lamb. Effective January 1969, as a % of the price of 100 lbs. live hog, Index 100. ⁶Price of 100 lbs. good steer as a % of the price of 100 lbs. good lamb. ⁷Quotations refer to steers all weights. ⁸Grade "B" hogs. Effective Jan 1969 prices based on Index 100, hogs. ¹Customs exports are adjusted to reflect actual physical movement of wheat flour from Canada.

Data shown for the last current year are not so adjusted.

²Production is calculated as the sum of the current manufacturers' shipments and the net change in manufacturers' inventories from the previous months. ³Includes baking and frying oils and fats. ⁴Includes stocks held by manufacturers and other warehouses. ⁵Includes fresh sausage, frankfurters, weiners and all other sausage. ⁶Includes solid, coated, bulk, packages and novelties. ⁷The quarterly data on jams, jellies and marmolodes which was previously collected on the basis of production will, starting with the first quarter of 1970, be collected on the basis of factory sales.

¹Total value of retail trade seasonally adjusted includes sales of department stores, general merchandise stores, variety stores and all other stores. Due to changes in definition of department stores, the re-classification of some variety store firms and the introduction of general merchandise stores, formerly in all other stores, the unadjusted and seasonally adjusted department store data for 1968 and subsequent years are not comparable with the data of previous years. ¹Department store stocks at end of period at selling value. The sales and stocks data are revised series based on the results of the 1961 Census of Merchandising and Service Establishments. ²Due to changes in definition of department stores and the introduction of general merchandise stores, formerly included in all other stores, the 1968, 1969 and 1970 figures are not comparable with the data of previous years. Source: Department Store Sales and Stocks (63-002), D. B. S.

¹ Credit extended mainly to individuals; includes unidentifiable amounts of credit extended for non-consumer purposes; excludes certain forms, mainly service credit extended by doctors, dentists, lawyers, pawnbrokers, travel companies, restaurants and personal credit for which no statistics are available. See also Credit Statistics (61-004).

² Owing to the considerable extent of common ownership and overlap of function within these two groups of companies their holdings are treated jointly beginning in January 1970. ³ Conditional sales agreements held by sales finance companies and by consumer loan companies in connection with the financing of retail purchases of consumers' goods and repaid in instalments. ⁴ Personal cash loans of up to \$1,500, made by companies licensed under the Small Loans Act. Amounts shown are net of interest and other finance charges. ⁵ Personal cash loans of over \$1,500, usually repaid in instalments. Amounts shown include interest and other unearned income finance charges. ⁶ The data for Quebec savings banks loans and motor vehicle dealers are not seasonally adjusted as no seasonality is present; these series are reported in the unadjusted form. ⁷ Starting with January 1970, the sales finance companies component of consumer credit has been changed by the transfer of passenger cars financed for commercial purpose, from consumer goods to commercial goods.

¹Column numbers refer to tables 3 and 4 section 11. ²Includes special transaction-trade, not shown separately. ³The annual index, being calculated separately, will differ slightly from the index obtained by the average of the twelve months. ⁴Revisions made to ensure consistent coverage. The most important are: Farm machinery (73) now includes tractors; Drilling, excavating and mining (68-72) now exclude metalworking, woodworking machinery, etc. Source: Trade of Canada, Exports (65-004), D. B. S.

¹Column numbers refer to tables 3 and 4, section 11. ²Includes special transaction-trade, not shown separately. ³Includes scrap. ⁴The annual index, being calculated separately, will differ slightly from the index obtained by the average of the twelve months. ⁵Same series such as General purpose machinery have been revised to ensure consistent coverage. Other important revisions were: Paper and board (44) now excludes woodpulp; Drilling, excavating and mining (68) now include all and gas field machinery; Mechanical power transmission equipment (72) now exclude special industry machinery. Source: Trade of Canada Imports (65-007), D. B. S.

¹Monthly averages for years 1967 and 1968 differ from the averages of the monthly data due to revisions which cannot be allocated by months. ²Prior to 1970, figures included the operations of scheduled and non-scheduled carriers in financial reporting groups I-IV. These groups covered all air carriers with gross annual flying revenues of over \$100,000 prior to January 1969 and over \$150,000 during 1969. Figures for 1970 include only the operations of the seven largest airlines in Canada. These transcontinental (Air Canada and CP Air) and regional airlines (Eastern Provincial Airways, Nordair, Pacific Western Airlines, Quebecair and Transair) normally account for approximately 95 per cent of the total revenues and expenses reported by Canadian commercial air carriers. ³United States and other foreign carriers having scheduled services into and out of Canada. Excludes passengers in transit through Canada. ⁴Cargo includes air freight and express but excludes mail and excess baggage. Source: Civil Aviation (51-001), D.B.S.

¹The number of stocks included has varied over the period; the totals shown in the column headings represent the current coverage. ²The headings for "base metals" and "industrial mines" are not found in the Standard Industrial Classification. ³Combines the industrials, utilities and finance common stocks. ⁴Stocks included in industrial mines are listed on the exchanges as industrials. Their operations include smelting and refining. ⁵Includes also the machinery industries (except electrical machinery) and the transportation equipment industries. ⁶Stocks included in the mining index are for producing mines. ¹The statistics of failures in this table are limited to those bankruptcies filed under Federal legislation (the Bankruptcy and Winding-Up Acts) and does not include failures, sales or seizures carried out under other legislation. The figures for Atlantic provinces may be obtained by subtracting the sum of Quebec, Ontario, Prairie provinces and British Columbia from the total. ²In the Bankruptcy Act of 1949, provision is made for proposals from insolvent persons. Agreements made under this method are not included with the statistics of bankruptcies. Liabilities of insolvent persons making proposals are not available. CHANGES IN THE RELATIVE IMPORTANCE OF PROVINCIAL GOVERNMENT REVENUE SOURCES FROM 1966-67 TO 1970-71

CHART - 2

CHANGES IN THE RELATIVE IMPORTANCE OF PROVINCIAL GOVERNMENT EXPENDITURE FUNCTIONS FROM 1966-67 TO 1970-71

Shifts in the Composition of Aggregate Provincial Government Revenues and Expenditures

Having delved at some length into trends in provincial government revenues and expenditures over the past five years, it is interesting to consider the shifts which these trends brought about in the relative importance of the revenue sources and expenditure functions at this level of government. Graph 1 depicts the experience on the revenue side while Graph 2 pictures what happened on the expenditure side. This analysis shows that, of all the revenue sources considered on Table 1, only four, namely personal income tax, the category called "other provincial taxes", and the revenues from conditional and unconditional transfers, grew in relative importance during the period. All other declined to a greater or lesser extent. This is understandable since the sources with the more rapidly increasing yields obviously stood to gain in relative importance as provincial revenue providers. The interesting observation, however, is the extent of the decline sustained by certain sources and more particularly by motor vehicle licences and permits (from 3.55 per cent to 2.72 per cent of total revenue) and motor fuel tax (from 10.36 per cent to 7.87 per cent of total revenue). This downward shift can, to a large extent, be explained in terms of comparatively low personal disposable income elasticity for these revenue sources.¹² On the expenditure side, the relative importance of education and especially health in provincial spending grew considerably. These two functions account for 57.39 per cent of all provincial outlays in 1970-71, up 6.57 per cent from 1966-67. This increase in their aggregate share of provincial expenditures was realized largely at the expense of transport and communications, a function which dropped in relative importance from 16.49 per cent to 10.24 per cent over the same period. Spending for general government and debt servicing also increased in relative importance during the period while the proportions of outlays for welfare, transfers to other levels of government, and other provincial expenditures declined marginally. The drop in the relative importance of welfare outlays may reflect in part the lesser need for transfers to persons as a result of the ever-growing assumption of the provision of essential social services by government.

Interprovincial Comparisons

(a) General.—Two tables have been prepared comparing the provincial experiences over the years of the period of observation. They show the changes that took place over the entire period rather than levels at the beginning and end of the period. Table 3 deals with the revenue side while Table 4 deals with the expenditure side.

¹² From the author's personal observation, receipts from these sources bears closer functional relationship to population aged 14 and above than to personal disposable income.

(b) Revenues.—Obviously it is difficult to be definitive in commenting on revenues; tax increases of varying extent distort interprovincial comparability. Standardization of yields to counter such structural changes entails an intricate process of adjustments that would extend the scope of the present study well beyond what is intended. Having expressed this caution, it is still possible, however, to make some interesting observations. Personal income tax revenue increased very sharply in most provinces particularly in those that raised the rate of their levy (e.g. Newfoundland, New Brunswick, Manitoba and Alberta). Quebec and Saskatchewan, however, did not fare as well. This is somewhat surprising for Quebec because the province did raise its personal income tax by something in excess of three percentage points of "basic tax" (6 per cent surtax on provincial tax plus curtailment of dependant exemptions). The Saskatchewan situation is more readily understandable in view of the fluctuations of the international wheat market. In the area of corporation income tax, the Ontario and Alberta experiences (assisted in the latter case by a one percentage point tax increase) overshadowed by far those of the other provinces. Quebec's gain was the lowest of all the provinces; to some extent this can be explained by the fact that the province did not in 1967 benefit from an additional one percentage point abatement of federal tax as did the other provinces since it was already enjoying the full 10 per cent abatement. Not much can be said about the yields of the other provincial tax revenue sources because of the multiplicity of rate changes that affected them. In the area of transfers from other levels of government and especially that of unconditional transfers, it is found that the provinces with the lowest overall revenue increase potential gained the most during the period 1966-67 to 1970-71. This is readily understandable since equalization is a major component of unconditional transfers. Quebec benefitted appreciably from this redistribution exercise. The full story of unconditional transfer payments for Quebec must, however, make mention of the special payments which the province receives under the Established Programs (Interim Arrangements) Act.¹³ These payments increased from \$58 million in 1966-67 to an estimated \$215 million in 1970-71. An interesting piece of general information brought out by Table 3 is that the more affluent provinces like Ontario, Alberta and British Columbia, which are also the provinces where population has traditionally increased the fastest, were during the years of the period in a position to obtain a sizeable proportion of their new revenue from addition to their population. The other provinces were forced by the reverse phenomenon to rely more on tax increases to obtain the additional monies necessary to pay for their increased expenditures.

¹³ Adjustment payments to fiscal compensation for having opted out of certain shared-cost programs.

Notes: 1. First figure in \$'000,000 is the global change from 1966-67 to 1970-71; second figure (% between round brackets) is percentage change on a global basis from 1966-67 to 1970-71; third figure [% between square brackets] is percentage change on a per capita basis from 1966-67 to 1970-71.

2. Unless the population of a province actually declined between 1966-67 and 1970-71 (the only province in this situation is Saskatchewan), the percentage increase on a global basis should always be greater than the percentage increase on a per capita basis. The only exceptions to this rule are usually found in instances involving small per capita amounts and are due to rounding.

Notes: 1. First figure in \$'000,000 is the global change from 1966-67 to 1970-71; second figure (% between round brackets) is percentage change on a global basis from 1966-67 to 1970-71; third figure [% between square brackets] is percentage change on a per capita basis from 1966-67 to 1970-71.

2. Unless the population of a province actually declined between 1966-67 and 1970-71 (the only province in this situation is Saskatchewan), the percentage increase on a global basis should always be greater than the percentage increase on a per capita basis. The only exception to this rule are usually found in instances involving small per capita amounts and are due to rounding.

Sources: DBS *Provincial Government Finance - Revenue and Expenditure* (Catalogue No. 68-207) for 1966-67 and DBS *Provincial Government Finance - Revenue and Expenditure (Estimates)* (Catalogue No. 68-205) for 1970-71.

(c) **Expenditures.**—Table 4 provides an inter-provincial comparison of changes in outlays on the main functions of provincial government expenditures. The largest spending increases in absolute terms during this period occurred in the areas of education (\$2,141 million for all provinces) and health (\$2,112 million for all provinces). The percentage global increase for outlays on education fluctuated from a low of 37.2 per cent in Newfoundland to a high of 251.2 per cent in New Brunswick. The sharp rise in New Brunswick resulted in large part from institutional changes that saw the provincial government assume responsibilities which, in the other provinces, usually devolve on local authorities. If abstraction is made of the Newfoundland and New Brunswick experiences, the percentage increases on a global basis recorded by the other provinces are found to range from 61.8 per cent to 150.6 per cent. In the area of health, provincial government expenditures rose on a global basis within a band of 44.2 per cent to 187.5 per cent. The comparatively low increase in spending on this important function in Saskatchewan is explained by the fact that the province was the only one to have a comprehensive health program that included both hospitalization and medicare at the beginning of the period and that this program subsequently required little improvement in terms of extent of services provided. For the other provinces, the years 1966-67 to 1970-71 witnessed the inception of medicare which, together with the extension of hospitalization services already provided, resulted in increases in health outlays ranging from 68.3 per cent to 187.5 per cent on a global basis.¹⁴ Undoubtedly the high rate of increase of health expenditures has put severe strains on provincial budgets in recent years. In the area of welfare, increased provincial government spending ranged on a global basis all the way from -1.6 per cent in Prince Edward Island to 161.3 per cent in Nova Scotia. Little can be said about interprovincial differences in this area except to point out that the

¹⁴ All provinces will have a medicare program at March 31, 1971 but, for several of them, this will be a new development that will have been only partially operative in 1970-71.

only four provinces with rates of growth above the national average were Nova Scotia, New Brunswick, Quebec and Ontario. Conceivably, the experiences of Quebec and Ontario might point to an acceleration in the rate of concentration of the poor in our society in the larger cities of the country. The area of debt charges also deserves some comments. The percentage increases shown for Alberta and British Columbia may appear somewhat extraordinary but they have to be taken in the context of a virtual absence of outlays of this kind for the two provinces in 1966-67. However, for the Maritimes as well as for Quebec and Ontario, debt servicing indeed constituted an area of rapidly accelerating expenditures over the period 1966-67 to 1970-71. This is in part a reflection of the fiscal posture of these provinces during these years and in part the result of the need to refinance comparatively large proportions of their indebtedness under high interest rate conditions. One final comment can be made in connection with Table 4: the comparison of the percentage global increases in outlays on the main functions of provincial expenditures with the corresponding per capita percentage increases shows quite clearly that the advantage derived on the revenue side by the more affluent provinces in securing additional revenue through more rapid population increase is offset to some extent on the expenditure side by the fact that the need to extend their services to satisfy the wants of the same rapidly increasing population appears to add relatively more to their global outlays.

Conclusions

As is shown by Tables 1 and 2, provincial governments moved from a revenue position of \$7,151 million in 1966-67 to \$13,508 million in 1970-71 and from an expenditure position of \$7,621 million in 1966-67 to \$14,126 million in 1970-71. Their deficit did not change much in absolute terms increasing only from \$470 million in 1966-67 to \$618 million in 1970-71. In fact, in terms of percentage of their revenue, it decreased from 6.57 per cent in 1966-67 to 4.58 per cent in 1970-71. There were wide differences in individual provincial experiences, however, as the following table readily indicates:

TABLE 5. Surplus or Deficit Position of Provincial Governments in 1966-67 and 1970-71

| Province | 1966-67 | 1970-71 |
|----------------------------|--------------|--------------|
| | \$'000,000 | |
| Newfoundland | (95) | (62) |
| Prince Edward Island | (11) | 2 |
| Nova Scotia | (18) | (120) |
| New Brunswick | (19) | (20) |
| Quebec | (298) | (234) |
| Ontario | 32 | (109) |
| Manitoba | (15) | 5 |
| Saskatchewan | (6) | 10 |
| Alberta | (82) | (109) |
| British Columbia | 42 | 19 |
| Totals | (470) | (618) |

Note: Figures without brackets represent surplus; figures in brackets represent deficit.

CANADIAN STATISTICAL REVIEW

Cette revue est disponible en édition française, Revue Statistique du Canada, n° du catalogue 11-003F.

Series published in this Review are stored in CANSIM, the computerized time series data bank of the Dominion Bureau of Statistics. All or any part of the data bank contents may be purchased on magnetic tape or as computer printouts. For additional information, see inside back cover.

Selected Economic Indicators appearing in the Section 1 are published in seasonally adjusted form. Seasonally adjusted data are most useful for analysis and forecasting as they bring out the underlying trends of economic time series. Seasonal adjustments remove the effect of repetitive intra-year variations resulting from normal differences in weather, holidays with invariable dates, or other events which repeat with the same timing. Additional adjustments may be necessary for series which contain variation due to the difference in working or trading-days in each month or for holidays or other events with variable dates. Such adjustments are made prior to the seasonal adjustment but are treated as part of the seasonal adjustment.

The seasonal adjustment method applied to economic time series at the Dominion Bureau of Statistics is a computerized ratio-to-moving average method. The standard computer program used in the Bureau is the US Bureau of the Census Method II. The X-9 version is used for Labour Force data; for other data adjusted by computer the X-11 version is used.

The *MCD*, or *Months for Cyclical Dominance*, in a table containing seasonally adjusted series indicates the smallest span of months for which the average change in the cyclical factor is greater than that in the irregular factor. For the smoothest series the MCD is 1, for the most erratic series it is 6. Applying moving average of the period equal to the MCD tends to smooth irregular movements which may obscure the underlying trend-cycle.

Smoothed data have been used for the graphs of some of the seasonally adjusted series with MCD of 4, 5 or 6. A 5-term moving average was applied for smoothing these series.

* * * * *

A weekly supplement containing data published between release dates of this review is distributed free of charge to all subscribers. Historical data for *Selected Economic Indicators*, both unadjusted and adjusted for seasonal variation, are distributed to subscribers in an Annual Supplement.

NOTE TO USERS

Changes occur from time to time in tables contained in this Review to reflect newly available economic series, changes made in concept, composition, comparability, seasonal adjustment methods, benchmark data, etc. Changes in this issue are as follows:

Section 1, Table 11 — Prices

New Export and Import Price Index series have been introduced starting with the 1967 Statistics on 1968 price and weight base. Because of major changes in composition, these series are not comparable with previously published series (1948 = 100).

Section 6, Table 3 — Manufacturing Inventories

Unadjusted data for the following 5 columns: "Metal fabricating", "Machinery", "Transportation equipment", "Electrical Products" and "Non-metallic mineral products" have been corrected from June 1968 to May 1970 inclusive.

Section 10, Table 1 — Value of Retail Trade

Raw and seasonally adjusted data have been revised from 1966 to date. Revisions are bases on the 1966 Census.

THE USE OF FINANCIAL STATISTICS AS A MEASURE OF BUSINESS CONDITIONS

J.D. Wilson*

About the Statistics

In 1960, the Dominion Bureau of Statistics implemented a program designed to improve the coverage, quality and timeliness of the financial information available on the Canadian economy. The program centered around the production of quarterly financial accounts,¹ designed to shed more light on financial transactions, with particular emphasis on the sources and uses of funds for the various sectors of the economy. As part of the overall program, the quarterly financial statements survey of industrial corporations was initiated in the Business Finance Division.

Because of the increasing demand in recent years for current information on the financial position and results of operations of industrial corporations, the data from the survey were compiled to produce a new publication, issued in June 1970; *Industrial Corporation Quarterly Financial Statistics, 1962-1969* (DBS Catalogue No. 61-003). This publication contains balance sheets, income statements and statements of retained earnings for 25 industry groups within the industrial corporation sector of the Canadian economy and it is now published on a quarterly basis giving up-to-date statistics covering the most recent 16 quarters.

The following analysis is based on the statistics presented in this publication.

Limitations of the Statistics

When the financial statement survey was implemented in 1962, the primary purpose was to supply data to the System of National Accounts of the Dominion Bureau of Statistics. To meet the requirements of the Financial Flow Accounts, a part of the System of National Accounts, emphasis was placed on the financial assets and liabilities in the balance sheet. The presentation of the income statement was designed so that the "net profit" (book profit) as reported by corporations could be adjusted to "base profit" which is the National Accounts concept of corporate profits. The major adjustments made to "net profit" to arrive at "base profit" include the removal from income of (a) dividends received from companies in Canada, and (b) profits on the sale of fixed assets and securities; and the removal from expenses of (a) depreciation and depletion charges and (b) provision for income taxes accrued on current period profits and deferred to future periods.

* Mr. Wilson is a chartered accountant who was in the public accounting and taxation fields prior to assuming his present position as financial analyst in the Industrial Corporation Section of the Business Finance Division of DBS.

¹ *Financial Flow Accounts 1962-67*, DBS Catalogue No. 13-530. *Financial Flow Accounts, Quarterly* DBS Catalogue No. 13-002.

With the emphasis placed on the principal users mentioned above, consideration was not given to the presentation of the financial statements in a way which would lend itself to some of the standard ratios and percentages used in analyzing the statements.

The analysis of profitability would be enhanced by the addition of such items as material costs, labour costs and interest on short and long-term debt. To improve the measure of liquidity, a breakdown between current and long-term "investments in Canadian and foreign securities" and "debts owing to parent and affiliated companies" would be useful. If financial assets and investment income could be segregated so that certain asset accounts would be related to corresponding income accounts, it would improve the measurement of the "rate of return".

A word of caution is necessary at this point concerning assumptions that might be made about the financial statistics and their analysis. The data are based on a composite of financial statements from many corporations added together and inflated to universe proportions in each industry. One cannot make the assumption that the ratios and percentages produced from the statistics necessarily represent the average for the industry. The size, geographic location, financial structure, methods of production and marketing of each corporation in an industry is quite distinct. To move closer to a representative homogeneous grouping of corporations, consideration would have to be given to publishing statistics in finer industrial classifications and by size groups.

Developmental Programs

Work is now being carried out by the Dominion Bureau of Statistics to integrate the various series of financial statistics produced. One of the projects being carried out to achieve this objective is the standardization of classifications and definitions of balance sheet and income and expense accounts.

The Industrial Corporation Section of the Business Finance Division is now developing specialized financial statements for certain industries along with other modifications to all the statements which will be incorporated in the publication² in the near future. The objective of this project is to present the data in a more meaningful way to facilitate the analysis of liquidity, flow of cash, financing and profitability of each industry.

At the present time the Construction, Agriculture, Fishing and Trapping industries' statistics are not included in the sector's statistics published. It is anticipated that, with an improvement of the survey coverage, the Construction industry data will be published in the near future.

² *Industrial Corporations Quarterly Financial Statistics*, (DBS Catalogue No. 61-003).

About the Analysis

The analysis is based on the following major industrial groups:

| Major industry group | S.I.C. Code No. ¹ |
|---|---------------------------------|
| (1) Mining | 051-099 |
| (2) Manufacturing | 101-399 |
| (3) Transportation and Storage (referred to as "Transportation" in this article) | 501-527 |
| (4) Communication | 543-548 |
| (5) Utilities | 573-579 |
| (6) Wholesale and Retail Trade (referred to as "Trade" in this article) | 602-699 |
| (7) Service | 801-899 |

¹ S.I.C. — *Standard Industrial Classification, Manual*
DBS Catalogue No. 12-501.

Conventional financial statements of corporations usually consist of at least two separate but interrelated parts: the "Balance Sheet", presenting the financial position of the corporation in the form of an equation, "Assets = Liabilities + Shareholders' Equity," and the "Income Statement", which states the results of operations (Revenue, Expenses and Profit). The link between the "Income Statement" and the "Balance Sheet" is the "Statement of Retained Earnings" which indicates the changes in earnings retained in the corporation for a period of time.

Traditionally, the standard corporate financial statements are published to communicate meaningful financial data to a wide variety of users such as shareholders, prospective investors, investment analysts, credit grantors, governments and regulatory authorities, all of whom rely heavily on these data to assist them in the decision making process.

Financial statements require interpretation which is facilitated by the use of various analytical techniques. Mere examination of the components of a statement cannot lead to definite conclusions on the financial status of an industry.

The techniques used in analyzing financial statements involve the comparison or relationship of two or more variables in the statements presented in the form of ratios, percentages and indices. The relationship of variables in a specific set of statements is usually referred to as a static analysis, while comparisons of a certain variable in a series of statements covering a period of successive years is usually referred to as a trend analysis. In this statistical time series,² the trend or change in Profit is a very important economic indicator.

Static Analysis

An important principle in static analysis is that certain reasonable proportions should exist

² *Industrial Corporations Quarterly Financial Statistics*, (DBS Catalogue No. 61-003).

among the various items in the financial structure of a corporation. When interpreting various measures, one must decide whether the relationship is satisfactory or not, based on experience or on a comparison with normal or average ratios for an industry.

Measurement of Short-term Liquidity

Current assets represent the most liquid assets, in that they will be converted to cash within the current accounting cycle, and current liabilities represent obligations that will be discharged in the current accounting cycle, which is usually one year. While "Working Capital" is defined as the excess of current assets over current liabilities, or the equity of the owners in the current assets, the measure of short-term liquidity commonly used is the ratio of current assets to current liabilities, or Working Capital Ratio. Table 1 and Chart 1 show Working Capital Ratios for the sector as a whole, by years from 1962 to 1969, inclusive.

Relationship of the Equities

A fundamental relationship of equities is seen in the comparison of investments by creditors and investments by shareholders. Shifts in this relationship could be caused by many factors such as the financing of capital expenditures through debt capital or an increase in share capital (issuance of new shares).

Financial Leverage

A desirable objective of corporate management is to utilize borrowed capital at a fixed rate of interest which is lower than the rate of profit to capital invested in the business. This procedure is called "trading on the equity" or "leverage". Although this procedure may yield higher profits, there is an inherent danger involved. For example, during periods of recession a decline in sales volume could lower the earnings to a point where the fixed interest charges on the debt capital would exceed the profit before interest, thus converting the profit after interest into a loss.

Table 2 compares the relationship of shareholders' equity to short-term loans, long-term debt, and to total short-term loans and long-term debt.

Comparative Financial Structures of Major Industry Groups

Table 3 illustrates the distinct financial characteristics of individual major industry groups. The table is divided into two groups; Group I includes Communication Utilities and Transportation; Group II includes Mining, Services, Manufacturing and Trade.

The first group traditionally are heavily financed by debt capital. This is possibly due to the fact that these industries are partially regulated by government, and because they require a high level of fixed assets, and the majority of companies are very large. The regulated industries have less growth potential

DEVELOPMENT OF MANPOWER STATISTICS WITH PARTICULAR REFERENCE TO MANPOWER FORECASTING AND MANPOWER TARGETS

H. Buckley and D.J. Bailey*

As a background to the examination of the development of manpower statistics in the Canadian context, it is necessary to review briefly the economic circumstances of recent years since statistical developments are strongly influenced by policy needs, which in turn are based on the state of the economy.

During the past decade the Canadian labour force has experienced an annual growth rate of about 2.5 per cent, rising from about 6.5 million in 1960 to 8.2 million in 1969. This compares with an annual growth rate of about 2 per cent in the previous decade.

Underlying the overall growth of labour force over the past decade are substantial variations in the experience of different sectors of the economy. Employment in agriculture declined from almost 700,000 in 1960 to just over 500,000 in 1969. Conversely, employment in manufacturing rose from about 1.4 million to over 1.8 million in the same period. As a further indication of the growing maturity of the Canadian economy, employment in the service sector, including government service, increased from about 1.5 million in 1960 to almost 2.4 million in 1969.

At the beginning of the 1960's, the rate of employment was at the lowest level since World War II. This situation gradually improved, as shown in the table below, but the goal of an employment rate of 97 per cent as suggested by the first report of the Economic Council of Canada¹ was never achieved and in only two years, 1965 and 1966, did the rate rise above 96 per cent. Unemployment rates, adjusted to conform in definition and coverage, have consistently been higher than those of most industrialized nations including the United Kingdom, though they differ but little from the American.

Annual average employment rates, Canada, 1960-69 inclusive:

| | |
|------------|------|
| 1960 | 93.0 |
| 1961 | 92.9 |
| 1962 | 94.1 |
| 1963 | 94.5 |
| 1964 | 95.3 |
| 1965 | 96.1 |
| 1966 | 96.4 |
| 1967 | 95.9 |
| 1968 | 95.2 |
| 1969 | 95.3 |

*Prepared for presentation at the Conference of Commonwealth Statisticians held in New Delhi, India, November 1970, by Mrs. H. Buckley, Chief, Special Manpower Studies, Regional and Manpower Research Staff, and D.J. Bailey, Director, Labour Division.

¹ Economic Council of Canada, *First Annual Review*, Dec. 1964, p. 38

Within Canada, the upward movement of employment was felt in all parts of the country, yet unemployment rates have remained above the national average in certain regions and for certain classes of workers (youth, older men, unskilled etc.). At the same time, as employment expanded there emerged serious problems of occupational and locality shortages.

The major policy response dates from 1966 with the establishment of the Department of Manpower and Immigration, which marks a full commitment to selective manpower policies as necessary complements to main policy levers operating on the demand side. The approach is not wholly new, the federal government having undertaken to assist the matching of workers and jobs through the National Employment Service as long ago as 1941. But it is much more comprehensive. In addition to offering an employment exchange, the new department embodies the key concept of promoting the mobility of labour—occupationally, industrially, geographically—to conform with changing labour market requirements. A co-ordinated program is offered, embracing counselling and placement services; training, retraining and educational upgrading; and financial assistance to workers moving from one place to another.

The total cost of federal programs affecting labour supply and the operation of the labour market is close to 10 per cent of total budget expenditures.

The brief experience with selective manpower policies serves to indicate both their importance and their limitations. On the one hand, with a downturn in employment growth but continued rapid growth in labour force size, it seems likely that high rates of youth unemployment would have been even higher in the absence of training and counselling directed to skills and trades in high demand. At the same time, the slackening in total employment growth is not amenable to action on the supply side; such policies also seem to be relatively ineffective in combatting the tendency for rising unemployment to concentrate in regions where unemployment and underemployment traditionally exceed the national average.

Regional income disparities in Canada reflect very different patterns in manpower utilization—differences which have persisted over many years. Illustration may be drawn from a recent study² which, having established a measure of "potential employment", calculated that over the last decade the Atlantic provinces lost 4 per cent to 8 per cent of this potential through unemployment and a consistent 12 per cent through non-participation in the labour force.

² DBS, Special Labour Force Studies, No. 8, *Underutilization of Manpower in Canada*.

LABOUR FORCE (More detail in Section 4, Table 3)

FROM NOVEMBER TO DECEMBER THE UNEMPLOYMENT RATE ROSE FROM 6.5 TO 6.6 PER CENT REFLECTING A 0.8 PER CENT DECREASE IN THE TOTAL LABOUR FORCE AND EMPLOYED, UNEMPLOYMENT REMAINING CONSTANT.

PRICES (More detail in Section 5; 13; respective Tables 2, 3 & 4; 9.)¹

THE INDEX OF THIRTY INDUSTRIAL MATERIALS DECLINED BY 0.8 PER CENT IN DECEMBER.

THE GENERAL WHOLESALE INDEX SHOWED AN INCREASE OF 0.1 PER CENT.

THE CONSUMER PRICE INDEX DECLINED 0.4 PER CENT FOR THE FIRST NOVEMBER-DECEMBER DECLINE IN OVER A DECADE.
THE FOOD INDEX DECLINED (FOR THE FOURTH MONTH) TO 125.6, ITS LOWEST LEVEL SINCE MAY OF 1969.

¹The occupational status of the majority of the persons destined to the labour force is determined by immigration officials by an examination of documentary evidence provided by the immigrants. The classification of occupations is similar to that used in the 1961 Census; see Occupational Classification Manual, Census of Canada, 1961, Catalogue Number 12-506. ²Includes logging, fishing, trapping and hunting. ³Includes mechanical and construction. ⁴Includes a small number in non-specified occupations. ⁵Does not include students entering Canada on students' visas. ⁶Includes also retired persons, elderly dependents, fiancés or fiancées and other unspecified persons not intending to enter the labour force. ¹Excludes profits of government business enterprises. ²Includes the withholding tax applicable to this item. ³Includes profits (net of losses) of government business enterprises and other government investment income. ⁴Includes value of physical change in farm inventories. The seasonally adjusted data includes an arbitrary smoothing of crop production and standard seasonal adjustment for with-drawals of grain from farm stocks and the change in other farm-held inventories. Because of the arbitrary element, too precise an interpretation should not be given the seasonally adjusted figures. ⁵Includes net income of independent professional practitioners. ⁶See footnote 4, Table 1.2. Source: National Income and Expenditure Accounts, Third Quarter 1970 (D. B. S. 13-001).

¹Includes defence expenditures. ²Includes outlay on new durable assets such as building and highway construction by governments, other than government business enterprises. Excludes defence construction and equipment which are defined as current expenditure. ³Includes capital expenditures by private and government business enterprises, private non-commercial institutions and outlays on new residential construction by individuals. Capital expenditure is defined to include all transfer costs on the sales and purchases of the existing land and buildings. ⁴The book value of inventories is deflated to remove the effect of price changes and the derived "physical" change is then valued at average prices of the current period to obtain the value of physical change. The difference between this value of physical change and the change in book value is called the inventory valuation adjustment. (as shown in Table 1.1) ⁵See footnote 4, Table 1.1 Source: National Income and Expenditure Accounts, Third Quarter 1970 (D. B. S. 13-001).

¹The implicit price deflators of the seasonally unadjusted components of Gross National Expenditure, derived by dividing the value figures in current dollars by the constant dollar figures, are not suitable as indicators of quarter-to-quarter price change. This is because they are currently weighted and therefore are affected by compositional shifts which occur within the unadjusted components of Gross National Expenditure, on a quarter-to-quarter basis. Quarter-to-quarter movements in the implicit price deflators based on seasonally adjusted data are less subject to the problem of shifting weights and may be used as a measure of price change.

¹Includes the newly imposed taxes on life insurance companies. At the present time, for National Accounts purposes, life insurance companies are treated as associations of individuals in so far as their investment activities are concerned. The new taxes are thus included here pending a complete review of the treatment of insurance.

²Excludes the refundable tax on corporate cash profits introduced May 1966. Refunding of the tax began in the third quarter 1968. ³Withholding taxes.

⁴The quarterly figures of real property taxes unadjusted and seasonally adjusted are obtained by dividing annual totals by four since real property tax rates have been generally upward, this treatment gives rise to a fictitious seasonal between the fourth and first quarters in the seasonally adjusted taxes of series.

Table 1.7: government revenue, expenditure, and surplus or deficit, by level of government - continued

¹These implicit indexes are currently weighted price indexes. They reflect not only pure price changes, but also changing expenditure patterns within and between major groups. Quarter-to-quarter comparisons based on the seasonally adjusted Dato are less subject to the problem of shifting weights than are similar comparisons based on data unadjusted for seasonality, and therefore may be used as indicators of price change.

Table 1.9: relation between gross national product at market prices and gross domestic product at factor cost, (million dollars)

¹A minus sign except for official monetary movements, indicates an outflow of capital from Canada. ²Includes guaranteed issues. ³Bank balances and other short-term funds abroad (excluding official reserves). ⁴Includes changes in loans and accounts receivable and payable, and also balancing item representing difference between direct measurements of current and capital accounts. ⁵Canada's Special Drawing Rights are shown for the first quarter 1970. SDR's were issued January 1, 1970 by the International Monetary Fund (IMF) to member countries participating in the agreement. ¹Excludes inmates of institutions, members of the armed services, Indians living on reserves and residents of the Yukon and Northwest Territories. The estimates are derived from a sample survey and are subject to sampling error. In general, the smaller the estimate, the larger is the relative sampling error. ²The labour force as a percentage of the population 14 years of age and over. ³The unemployed as a percentage of the labour force. ¹The unemployed as a percentage of the labour force for each region. Due to weighting differences, a simple average of the regional rates will not give the seasonally adjusted Canada rate on page 7, nor the unadjusted Canada rate in table 3.

¹In calculating time loss, only the workers directly affected by the strike or lockout are taken into account; time lost by workers indirectly affected, such as those laid off as a result of a work stoppage is not included. ²The statistics for individual industries exclude strikes and lockouts involving fewer than 100 workers; the total, however, includes all work stoppages. The agricultural, finance, insurance and real estate and public administration and defence industries are not shown separately; should strikes occur in these industries, they also will be shown in the total. ³Includes miscellaneous manufacturing industries. ⁴Includes also publishing and allied industries. ⁵Includes also the storage and communication industries.

¹The data in Tables 12 to 19 are based on reports from firms employing 20 persons or more in any month of the year and relate to the last pay periods in the month. Greater industrial and area detail and more explanatory notes are given in the source publication named below. ²Excludes agriculture, fishing, trapping and public administration and defence. ³Includes storage, electric power, gas and water utilities. ⁴Excludes domestic service. ¹Total commodities and services does not add up to 100 per cent; the portion of shelter which includes taxes and mortgage interest, and amounts to 8 per cent, is excluded. ²These indexes measure within each city the percentage change in consumer prices from the base period to the subsequent time periods. They cannot be used to compare levels of prices between cities. Information on inter-city retail price differentials is contained in technical note No 6 published in the June 1969 issue of the Canadian statistical review. ¹Monthly shipments represent an estimated projection of the latest available Census of Manufacturers values except for those industries whose long-term contracts result in large intermittent shipments; for these a monthly estimate of work put in place has been substituted. ²Total manufacturing inventory owned by manufacturers including warehouse stocks. ³Total new orders received during the period at estimated selling value, net of cancellations, regardless of whether the orders will be filled from stock or as a result of activity during the same month. ⁴Annual figures for inventories and unfilled orders are end of December values.

¹Monthly shipments represent an estimated projection of the latest available Census of Manufacturer's values except for those industries whose long term contracts result in large intermittent shipments; for these a monthly estimate of work put in place has been estimated. Source: Inventories, Shipments and Orders in Manufacturing Industries (31-001), D.B.S.

Table 3: manufacturing inventories¹ by industry based on the 1960 standard industrial classification (million dollars)

| end of year or month | total inventories owned | non- durables | durables | foods and beverages | tobacco products | rubber | leather | textile | knitting mills | clothing | wood |

¹Prior to January 1969 shoe classifications were different from those now in use. The change was undertaken in order to eliminate ambiguity. The discontinuity is virtually insignificant except perhaps in two classifications, i.e. girls' under size 4 and infants' and "little children's". Source: Footwear Statistics (33-002), D. B. S.

¹Data compiled according to the Steel Distribution Index revised January, 1964. Figures on net shipments relate to rolled steels products only. Shipments to consuming industries of costings, forgings and steel pipe are not included. ²Includes building contractors, public and utility construction, structural steel fabricators, national defence and public works and utilities. ³Includes appliances and utensils. Note: Some groupings are not entirely comparable to year 1964 due to change in classifications but in general the differences are minimal. ⁴Excluding shipments for re-processing of maker's own plant. ⁵Data on shipments of steel shapes to consuming industries are not available for this period (August 69 to November 69) due to the effect of strikes in this industry. Source: Primary Iron and Steel (41-001), D. B. S.

¹Production plus imports less re-exports, minus exports. ²Commencing January 1967, the value of new motor vehicles sold in Canada (as reported by manufacturers and distributors) was based on "actual cost to purchaser" rather than the suggested list price as in the past. Sources: Motor Vehicle Shipments (42-002), New Motor Vehicle Sales (63-007), Trade of Canada, Imports (65-007), Exports (65-004), D. B. S.

Note: Components may not add to totals due to rounding. Current figures in this table are preliminary and therefore subject to revision. ¹Includes crude oil, condensate and pentanes plus. ²Deliveries to refineries and exports do not add to total new supply due to losses, other uses and inventory changes. ³Gross new production by field less field flared and waste. ⁴By gas utilities, does not include imports. Sources: Crude Petroleum and Natural Gas Production (26-006), Gas Utilities (55-002), D. B. S.

¹The coverage was extended to 507 municipalities in 1948, and as of 1965, stands at more than 1,400; minor revisions are still being required in the table, due to the non-receipt of returns from a few small places. No account is taken of the building activity outside of registration areas. Actual operations normally follow the granting of permits but a number of projects are not undertaken or abandoned. The amount depends upon the statement of the applicant and considerable change may develop before the completion of the operation. Source: Building Permits (64-001), D. B. S.

¹A dwelling unit is defined as a structurally separate set of living quarters having its own entrance from outside of the building, or from a common passage inside. These data are the result of a nation-wide survey, for which the field work is carried out by the Central Mortgage and Housing Corporation. All metropolitan areas and urban centres with a population of 10,000 or more, along with certain other areas of high building activity, are enumerated completely each month. The remainder of the country is covered on a sample basis quarterly. ²End of period. Source: New Residential Construction (64-002), D. B. S.

¹Monthly totals are not equivalent to annual data which include Newfoundland and Yukon and Northwest Territories for which only annual statistics are collected. ²Planks and boards, flooring and square timber. ³Hollow blocks including fireproofing and load-bearing tile. ⁴For building insulation only.

⁵Figures cover the production of firms which normally account for 90 per cent of the total for Canada. ⁶Factory sales of firms which normally account for 96% of total Canadian production. Source: Concrete Products (44-002), Products made from Canadian Clays (44-005), Asphalt Roofing (45-001), Rigid Insulating Board (36-002), Iron Castings and Cast Iron Pipes and Fittings (41-004), Steel Wire and Specified Wire Products (41-006), Gypsum Products (44-003), Mineral Wool (44-004), Sales of Paints, Varnishes and Lacquers (46-001), Production, Shipments and Stocks on Hand of Sawmills (35-002), (35-003) monthly, (35-204) annual and Trade of Canada, Imports (65-007), Exports (65-004), D. B. S.

¹Cash receipts from farming operations excluding supplementary payments. Excludes Newfoundland. ²Represents participation payments made by the Canadian Wheat Board direct to producers on crops delivered in previous years. ³Includes rye, flaxseed, rapeseed, soybeans and corn. ⁴Includes clover and grass seed, hay, clover, greenhouse products, mustard seed, sunflower seed, hops, dry beans and dry peas and miscellaneous products. ⁵Made under the authority of the Agricultural Stabilization Act.

Note: Components may not add to totals due to rounding. ¹The estimates for the current year are subject to revision since the factors used in the blow-up are based on the previous years' operations and may change when the current annual totals for all firms are known the following year. ²Excluding trucks. ³The total value of all machines shown in this table is greater than the value shown for form machinery in section 10, table 3 which covers wholesalers proper only. The above table covers all sales to users and includes sales by manufacturers through their agents as well as the sales of importers and other dealers made directly to users. Even though sales are to users, i.e. farmers, values are stated at wholesale prices, i.e. cost to dealers. Source: Form Implement and Equipment Sales (63-009), D. B. S.

¹These indexes are available for January, April and August only. ²Average rates of cash wages paid per month to male hired help on farms. They reflect average of wages paid to all male farm help regardless of age and skill. Data available for Jan., May and Aug. only. ³Excl. of NFLD. Western grain prices used in the construction of the Index prior to Aug 1, 1967 are final. From Aug 1, 1967 to date, the western grain prices used in the Index are initial prices only for wheat, oats and barley. ⁴The number of bushels of No. 1 feed barley, or cwt of mixed feed, that equal in value 100 lbs. of Grade B live hog. Effective January 1969, equal in value to 100 lbs. of Index 100 live hog. ⁵Price of 100 lbs. good steer as a % of the price of 100 lbs. live hog, Grade B, or good lamb. Effective January 1969, as a % of the price of 100 lbs. live hog, Index 100. ⁶Price of 100 lbs. good steer as a % of the price of 100 lbs. good lamb. ⁷Quotations refer to steers of all weights. ⁸Grade "B" hogs. Effective Jan 1969 prices based on Index 100, hogs. Sources: Price Index Numbers of Commodities and Services Used by Farmers (62-004); Form Wages in Canada (21-002) Occasional; Course Grains Quarterly (22-001); Index Numbers of Form Prices of Agricultural Products (62-003), D. ¹Customs exports are adjusted to reflect actual physical movement of wheat flour from Canada. Data shown for the last current year are not so adjusted.
²Production is calculated as the sum of the current manufacturers' shipments and the net change in manufacturers' inventories from the previous months. ³Includes baking and frying oils and fats. ⁴Includes stocks held by manufacturers and other warehouses. ⁵Includes fresh sausage, frankfurters, weiners and all other sausage.
⁶Includes solid, coated, bulk, packages and novelties. ⁷The quarterly data on jams, jellies and marmalades which was previously collected on the basis of production will, starting with the first quarter of 1970, be collected on the basis of factory sales. ¹Total value of retail trade seasonally adjusted includes sales of department stores, general merchandise stores, variety stores and all other stores. Due to changes in definition of department stores, the re-classification of some variety store firms and the introduction of general merchandise stores, formerly in all other stores, the unadjusted and seasonally adjusted department store data for 1968 and subsequent years are not comparable with the data of previous years. Source: Retail Trade (63-005), D. B. S.

¹Department store stocks at end of period at selling value. The sales and stocks data are revised series based on the results of the 1961 Census of Merchandising and Service Establishments. ²Due to changes in definition of department stores and the introduction of general merchandise stores, formerly included in all other stores, the 1968, 1969 and 1970 figures are not comparable with the data of previous years. Source: Department Store Sales and Stocks (63-002), D. B. S.

¹ Credit extended mainly to individuals; includes unidentifiable amounts of credit extended for non-consumer purposes; excludes certain forms, mainly service credit extended by doctors, dentists, lawyers, pawnbrokers, travel companies, restaurants and personal credit for which no statistics are available. See also Credit Statistics (61-004).

² Owing to the considerable extent of common ownership and overlap of function within these two groups of companies their holdings are treated jointly beginning in January 1970. ³ Conditional sales agreements held by sales finance companies and by consumer loan companies in connection with the financing of retail purchases of consumers' goods and repaid in instalments.

⁴ Personal cash loans of up to \$1,500, made by companies licensed under the Small Loans Act. Amounts shown are net of interest and other finance charges.

⁵ Personal cash loans of over \$1,500, usually repaid in instalments. Amounts shown include interest and other unearned income finance charges.

⁶ The data for Quebec savings banks loans and motor vehicle dealers are not seasonally adjusted as no seasonality is present; these series are repeated in the unadjusted form.

⁷ Starting with January 1970, the sales finance companies component of consumer credit has been changed by the transfer of passenger cars financed for commercial purpose, from consumer goods to commercial goods.

¹Column numbers refer to tables 3 and 4 section 11. ²Includes special transaction-trade, not shown separately. ³The annual index, being calculated separately, will differ slightly from the index obtained by the average of the twelve months. ⁴Revisions made to ensure consistent coverage. The most important are: Form machinery (73) now includes tractors; Drilling, excavating and mining (68-72) now exclude metalworking, woodworking machinery, etc. Source: Trade of Canada, Exports (65-004), D. B. S.

¹Column numbers refer to tables 3 and 4, section 11. ²Includes special transaction-trade, not shown separately. ³Includes scrap. ⁴The annual index, being calculated separately, will differ slightly from the index obtained by the average of the twelve months. ⁵Same series such as General purpose machinery have been revised to ensure consistent coverage. Other important revisions were: Paper and board (44) now excludes woodpulp; Drilling, excavating and mining (68) now include oil and gas field machinery; Mechanical power transmission equipment (72) now exclude special industry machinery. Source: Trade of Canada Imports (65-007), D. B. S.

¹Monthly averages for 1966 and 1967 may differ from the averages of the monthly data due to revisions which cannot be allocated by months. ²Data in this table refer to class 1 and class 2 carriers which are railways with gross annual operating revenues of \$500,000 or over. Includes operations of United States railways operating in Canada but excludes operations of Canadian railways in the United States. ³Includes traffic interchanged between Canadian railways. Sources: Railway Operating Statistics (52-003) monthly, and (52-206) annual, D.B.S.

¹Monthly averages for years 1967 and 1968 differ from the averages of the monthly data due to revisions which cannot be allocated by months. ²Prior to 1970, figures included the operations of scheduled and non-scheduled carriers in financial reporting groups I-IV. These groups covered all air carriers with gross annual flying revenues of over \$100,000 prior to January 1969 and over \$150,000 during 1969. Figures for 1970 include only the operations of the seven largest airlines in Canada. These transcontinental (Air Canada and CP Air) and regional airlines (Eastern Provincial Airways, Nairair, Pacific Western Airlines, Quebecair and Transair) normally account for approximately 95 per cent of the total revenues and expenses reported by Canadian commercial air carriers. ³United States and other foreign carriers having scheduled services into and out of Canada. Excludes passengers in transit through Canada. ⁴Carga includes air freight and express but excludes mail and excess baggage. Source: Civil Aviation (51-001), D.B.S.

¹The number of stocks included has varied over the period; the totals shown in the column headings represent the current coverage. ²The headings for "base metals" and "industrial mines" are not found in the Standard Industrial Classification. ³Combines the industrials, utilities and finance common stocks. ⁴Stocks included in industrial mines are listed on the exchanges as industrials. Their operations include smelting and refining. ⁵Includes also the machinery industries (except electrical machinery) and the transportation equipment industries. ⁶Stocks included in the mining index are for producing mines. ¹The statistics of failures in this table are limited to those bankruptcies filed under Federal legislation (the Bankruptcy and Winding-Up Acts) and does not include failures, sales or seizures carried out under other legislation. The figures for Atlantic provinces may be obtained by subtracting the sum of Quebec, Ontario, Prairie provinces and British Columbia from the total. ²In the Bankruptcy Act of 1949, provision is made for proposals from insolvent persons. Agreements made under this method are not included with the statistics of bankruptcies. Liabilities of insolvent persons making proposals are not available. Note: The monthly data do not add to the annual totals which include supplementary payments arising from the closing of the accounts. ¹This statement does not include any disbursements other than regular budgetary expenditures. Excluded, for example, are all government outlays arising from increases in loans, advances and investments. ²Under the Technical and Vocational Training Assistance Act. ³Government contributions under the Hospital Insurance and Diagnostic Services Act. ⁴Includes treatment and rehabilitation services. ⁵For comparison purposes, annual figures for 1968-69 and 1969-70 represent "Grants to Universities—Payments to the Association of Universities and Colleges of Canada" (col. 6), "Capital Subsidies for the Construction of Commercial and Fishing Vessels" (Col. 8) and "Interim Payments to Railways to Maintain Freight Rates at Reduced Levels" (Col. 22). ⁶As of April 1, 1969 Industry and Trade and Commerce are combined. Sources: Canada Gazette and Dept. of Finance.

and produce a comparatively lower rate of return to shareholders, therefore, making it more difficult to attract share capital. On the other hand, because of their large size they have relatively easy access to the debt capital market as indicated by the high long-term debt to shareholders' equity ratio. They also distribute a much greater proportion of their income to their shareholders by way of dividends as opposed to retaining the income to finance growth.

By contrast, the second group is financed mainly through shareholders' equity. These industries, for the most part, have a greater growth and profit potential which enables them to attract share capital. They also retain a greater proportion of their income to finance growth as opposed to distributing the income to the shareholders. The industries having a greater growth potential are also potentially more speculative because of the uncertainty of the markets and prices.

¹ Net profit as a percentage of shareholders' equity.² Dividends charged to retained earnings.

Cash Flow Statement

This statement presents the various sources and uses of cash. This involves the recasting of the income and expenditures from an accrual to cash basis. Thus, cash generated from operations represents the excess of cash receipts over cash disbursements. Changes in balance sheet accounts, other than the accounts directly related to operating income and expense, are presented to illustrate the various methods of financing as sources of cash and the various items to which cash is applied.

The reader should not confuse this statement with the commonly used "Source and Application of Funds Statement" which presents the various sources and applications of working capital.

Table 4 below presents the relative proportion of the total cash provided, by each of the three main components; (a) cash raised through debt financing, (b) cash from affiliated companies and shareholders (defined as the sum of loans and advances from affiliates plus share capital) and (c) cash generated internally. A more detailed cash flow statement is presented in Table 5.

Measurement of Profitability

Sales are a fundamental dynamic force of a business enterprise and without adequate sales the

business would not succeed. Profit is the lifeblood of economic activity and is thought by many to be the single most important item in the financial statements.

An important step in the analysis of profit movement is the percentage of profit to sales. Comparing these percentages over a period of time gives an indication of shifts in the cost-revenue relationship. Analysis of the profitability of the ordinary business activity requires the removal from profits of extraneous revenue, such as dividend income, rental income, interest income and profits on the sale of fixed assets and securities.

Table 6 presents three profit figures as a percentage of sales (profit margins) for the eight years under review.

(A) "Net operating profit" (excluding extraneous revenue and income tax expense)

(B) "Net profit before income tax expense" (including extraneous revenue)

(C) "Net profit after income tax expense" (including extraneous revenue).

¹ Adjustments have been made in calculating the percentages to eliminate the effect of a change in accounting for dividend income for 1966 and subsequent years.

² Prior to 1965 "profit or loss on the sale of fixed assets and securities" was included in operating profit. In subsequent periods, this item was shown separately in other revenue.

Note: (A) Net operating profit (excluding other revenue); (B) Net profit before income taxes (including other revenue); and (C) Net profit after income taxes, all as a percentage of sales.

Rate of Return

Another test of profitability is the rate of profit earned on capital invested, referred to as the Rate of Return, as shown in Table 8 and Chart 5.

Return on shareholders' equity (capital invested by shareholders) provides an approximation of the rate earned by funds invested in the business. This measurement is subject to limitations identifiable with the accounting principle related to the valuation of assets, and is also influenced by the amount of leverage in the company's financial structure. From an investor's point of view, a more meaningful measure of profitability is the profit per common share, calculated by dividing the number of common shares outstanding into the net profit accruing to the common shareholders. This calculation can be taken one step further by dividing the market value per common share into the profit per common share to give the rate of return on shareholders' equity valued at current market value. This relationship is commonly stated, conversely, as the price-earnings ratio obtained by dividing the profit per common share into the market value per common share.

From a management point of view, the rate of return technique for evaluating performance and capital productivity has received greater attention in recent years. A primary objective of management is to utilize assets to yield the highest profit possible. In calculating the rate of return, an assumption

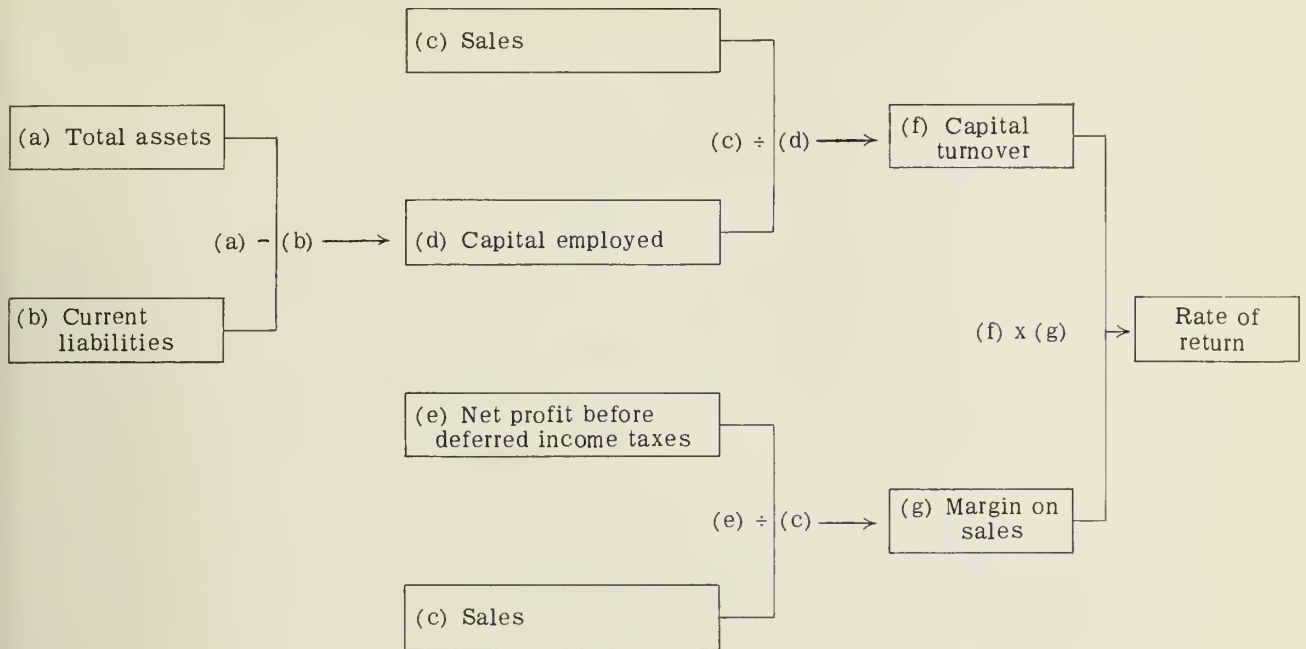

is made that may not be valid in all cases, and that is the direct relationship between assets included in the capital base and the income derived from utilization of these assets.

In contemplating this calculation, one must consider several questions:

- (1) Should capital invested include items on which management may not be expected to generate income, such as excess or idle assets, long-term investments or intangible assets?
- (2) What valuation should be placed on investments and fixed assets—gross book value, net book value or current market value, replacement cost, etc.?
- (3) What impact do leased assets versus owned assets have on the capital employed and rate of return?
- (4) To relate profit to capital invested, should adjustments be made to profit for such items as investment income, capital gains and losses, extraordinary non-recurring gains or losses, and prior period gains or losses?

Because of the limitations of the data available from the financial statements published it was found that the most useful approach to the calculation of the rate of return is that presented in the following exhibit.

EXHIBIT **Method of Calculating the Rate of Return**

In equation form, the rate of return is calculated as follows:

$$\text{Rate of return} = \text{margin on sales} \times \text{capital turnover}$$

or

$$\frac{\text{Net profit before deferred income tax}}{\text{Capital employed}} = \frac{\text{Net profit before deferred income tax}}{\text{Sales}} \times \frac{\text{Sales}}{\text{Capital employed}}$$

Capital employed is expressed as an average for each year, by taking ½ of the sum of the beginning and end-of-year balances.

The important factors in calculating the rate of return are consistency and comparability of data, while the exactness of methodology used in calculating the rate of return is considered less important.

CHART-4

TABLE 8. Industrial Corporation Sector, Rate of Return on Capital Employed by Major Industry Group
Annually, 1962 to 1969 inclusive

| | 1962 | 1963 | 1964 | 1965 | 1966 | 1967 | 1968 | 1969 |
|----------------------|------|------|------|-------|-------------------|-------------------|------|------|
| All industries | 6.09 | 6.82 | 8.01 | 8.51 | 8.00 | 7.14 | 7.08 | 6.92 |
| Mining | 7.34 | 7.60 | 9.96 | 10.26 | 8.96 | 9.32 | 9.14 | 8.06 |

| Transportation | 3.08 | 3.94 | 5.30 | 5.87 | 5.59 ¹ | 4.81 | 4.89 | 4.17 |
| Communication | 4.68 | 4.50 | 4.66 | 4.74 | 4.68 | 4.62 ² | 4.41 | 4.31 |
| Utilities..... | 4.58 | 4.55 | 5.61 | 5.54 | 5.38 | 5.41 | 5.42 | 5.29 |
| Trade | 6.32 | 6.50 | 7.12 | 8.88 | 8.23 | 7.60 | 7.55 | 6.57 |
| Services..... | 5.47 | 6.08 | 7.09 | 10.40 | 9.64 | 9.32 | 6.51 | 8.29 |

Notes: Adjustments have been made in calculating the percentages to eliminate the effects of the following:

¹ Change in accounting for dividend income in 1966 and subsequent years and

² Change in accounting for income tax expense from "Taxes Payable" to "Deferred Income Tax Allocation Method" in 1967 and subsequent years.

CHART-5

CHART-6

Analytical Highlights, 1962-69

Examination of the preceding analytical tables, reveals some behavioural patterns in the industrial corporation sector from 1962 to 1969.

For the sector as a whole, a dramatic increase in short-term loans was a major factor affecting short-term liquidity, which declined throughout the entire period with the exception of a levelling-off in 1968.

The Working Capital Ratio (Table 1) declined from 2.08 to 1.84 from 1962 to 1969 while short-term loans and long-term debt expressed as a percentage of shareholders' equity (Table 2) increased from 44.0 to 50.6 per cent. Increases were most significant in the years 1965, 1966, 1967 and 1969, when the growth in shareholders' equity did not keep pace with the increase in total assets. A factor contributing to the slowdown in equity growth was the decline in profit growth in 1966, 1967 and 1969, as indicated in the index of Net Profits (Table 7 and Chart 4).

The flow of cash, set out in Tables 4 and 5, again demonstrates the significant shift to debt financing. The cash required to finance investment in fixed assets surpassed the cash generated internally, thus causing the trend toward increasingly larger proportions of the sector's total financing being met by debt capital.

The exception to this trend appeared in 1968 with a dramatic turnabout of all three sources of the Total Cash Provided, set out in Table 4. This phenomenon appears to be compatible with the movement of other indicators: for instance, in 1968 a pause occurred in the downward trend of the Working Capital Ratio while short-term loans and long-term debt as a percentage of shareholders' equity fell off slightly. In 1968 also, profits showed a resurgence, increasing 12.1 on index, whereas total assets increased only 9.7. This resurgence of profits is also illustrated in Table 4 where cash generated internally increased from 67.7 per cent in 1967 to 73.6 per cent in 1968.

The behavioural patterns of profits in the industrial corporation sector are of particular interest, in that corporate profit movements are an important economic indicator and have a significant impact on many aspects of economic activity both within and outside the sector. With this in mind, changes in profits have been related to some of the more significant economic conditions³ prevailing at various times throughout the period.

³ Sources: *Federal Government Budget Speech*—June 1967,—October 1968,—June 1969, and—March 1970. *National Income and Expenditure Accounts*, DBS Catalogue No. 13-001; *Financial Flow Accounts*, DBS Catalogue No. 13-002.

The dramatic upward movement of profits in the first years of the period far outpaced the growth in sales and capital, indicating a marked improvement in Rate of Return on capital.

A peak in profits in early 1966 while sales continued to grow at a steady rate, however, caused profit margins to fall from 5.0 to 4.6 per cent. The Rate of Return also declined because of the lower profit margins and the higher level of capital employed, evidenced by the largest increase for the period in fixed assets (12.0 on index). Increased inflationary pressures on the cost side, and plant shut downs due to labour strikes contributed to shrinking profit margins toward the end of 1966.

During 1967, for the first time, profits declined reflecting the slackening pace of sales and declining profit margins. Most sectors of the economy experienced a softening in demand while inflationary pressures continued.

In 1968, profit margins showed a slight improvement, enabling profits to recover to a new high, slightly above the 1965-66 level. In addition, the sector restrained its spending programs on fixed assets which improved its rate of return on capital. The increase in profit did not, however, keep pace with the overall growth of the economy, as indicated in the declining ratio of profits to GNP shown in Table 10, page 121.

The following year profits continued to grow at a moderate rate but, again, did not keep pace with sales and the overall growth of the economy because of the much higher costs. During the latter part of the year credit conditions and strikes in the mining and manufacturing industries also had an adverse affect on profits.

Within the sector, an increase in Rate of Return from 1963 to 1964 for mining was caused by the dramatic increase in profits which outstripped the increase in sales and capital employed, illustrated in Tables 6 and 7. Capital employed, here defined as shareholders' equity and long-term debt, did not increase significantly, in part because of the short-term financing. A very significant item in this industry, "Debts owing to Parent and Affiliated Companies", which is classified as long-term debt, is probably the major reason for the substantially smaller current liabilities in relation to current assets over the period. For this reason the relationship of equities is probably a better measure of liquidity for the mining industry than the Working Capital Ratio.

Turning to manufacturing, the marginal profit after taxes increased while the margin of profit from operations decreased in 1966. This was explained mainly by a large increase in non-taxable dividend income.⁴ Notwithstanding this increase, however, the Rate of Return declined, caused by a tremendous expansion of assets, approximately \$3.2 billion, which was financed primarily by long-term debt. In the following year the decline in the Rate of Return was caused mainly by a 13 per cent drop in profits.

An examination of the transportation and storage industry reveals a substantial increase in short-term bank loans of approximately \$140 million and \$120 million respectively in 1967 and 1968. Use of the proceeds from the short-term bank loans to finance capital expenditures depressed short-term liquidity. The Working Capital Ratio in Table 1 illustrates this point in that the ratio dropped from 1.32 in 1966 to 1.13 in 1967, 1.07 in 1968, and 1.04 in 1969.

In measuring the financial strength of the communication and utilities industries, short-term

liquidity is relatively insignificant owing to the major impact on total assets of fixed assets and long-term debt. In the communication industry a notable decline occurred in the Working Capital Ratio in 1969, caused by a \$112 million increase in short-term loans raised to finance capital expenditures.

During 1963 a significant structural change in the utilities industry occurred when takeover by provincial governments of several hydro-electric power operations led to these entities being transferred from the industrial corporation sector to the non-financial government enterprise sector. Because of this structural change, the index of sales and net profits for the utilities industry dropped below 100 in 1963, 1964 and 1965. It is difficult to identify a trend in the relationship of equities in this industry (Table 2) because of random fluctuations caused by wide swings in the methods of financing from short-term loans to long-term debt and to paid-in capital.

Two significant increases occurred in short-term liquidity for the utilities industry, in 1965 and in 1969. The first, a significant conversion of approximately \$50 million from short-term to long-term debt, raised the Working Capital Ratio from 0.83 to 1.06. The second increase, from 0.86 to 1.02 in 1969, was influenced primarily by an increase of \$59 million in cash.

TABLE 9. Industrial Corporation Sector: Comparison of Net Profit, Fixed Assets and Total Assets

| Year | Net profit to fixed assets | Net profit to total assets | Fixed assets | Total assets | Net profit |
|------------|----------------------------------|----------------------------------|------------------|-----------------|---------------|

Federal programs aimed at increasing employment in lagging regions predate the new manpower services by several years and have been given added emphasis with the still more recent establishment of the Department of Regional Economic Expansion. The proposed program is strongly oriented to the development of secondary industry, using locational assistance and investment in supporting services—transportation, education, etc.—as the major means. A very close co-ordination with the manpower services is expected. In areas where industry is to be fostered, developmental programs are likely to provide for training of the local labour force; elsewhere, lacking the necessary potential for industry growth, adjustment may be sought through assistance for relocation of workers.

New Data Developments

The statistical requirements of full-employment policies are largely met by regular and frequent information on changes in population, labour force employment and unemployment. The Monthly Labour Force Survey of households which supplies these indicators has long been an important source of policy-oriented manpower statistics in Canada. But selective manpower policies require much more detailed knowledge both of workers and of the labour market, hence their adoption has required extensive efforts to improve and extend the statistical system.

The most serious deficiency was encountered on the demand side, there being a wide range of data on labour supply. In addition to leading indicators, the Monthly Labour Force Survey supplies a number of labour force characteristics, useful in the analysis of trends; there is also a system of establishment surveys which adds importantly to the industrial detail available for employment data, as well as supplying hours of work and earnings. But the urgent need confronting on-going programs was for specifics on labour demand: to guide the placement services, to determine the occupations for which the unemployed and the new entrants should be trained, for formulating an immigration policy appropriate to the needs of the economy.

From the operational standpoint, the most urgent need was for detailed and specific measures of job vacancies. Existing measures (orders placed by employers with the public employment service) were plainly insufficient because many employers did not use the facilities, particularly for locating skilled workers. Thus, administrative statistics were not representative of either the total of unfilled demand or the occupational mix. To fill this gap, a comprehensive, national survey of occupational job vacancies was initiated; this survey has just recently reached the operational stage.

Among the first attempts in any country to collect information on vacancies in any systematic way, the development process extends back to the first step of defining a vacancy. Prior developments in supply measures were taken as a broad guide to

establishing a demand definition; thus, the vacancy must be available for filling at the present time, and the employer must be actively seeking workers to fill the vacancy. To ensure reflection of impact on the labour market, only those vacancies are counted for which the employer is seeking workers outside the firm. For precision in measurement, vacancies must be in existence for a specific period—a full day.

Conceptually similar to job vacancy measures being developed in the United States, the Canadian survey provides much more complete coverage of the economy (all industries except agriculture) and uses more intensive techniques of collection. In addition to the initial mail survey the Canadian program also makes provision for an interview phase covering a substantial proportion of the surveyed universe each month. The interview is primarily intended to reveal, through indirect questioning, the accuracy of the information obtained in the mail survey and to provide a basis for adjustment for non-response.

The survey will provide vacancy data by occupation and industry, with considerable occupational detail at the national level and, on a more aggregative basis, for regions and the more important labour market areas.

The growing importance of occupational data also launched a major re-examination of the several classification systems used in Canada with the intent of developing a standard system which could meet the needs of all users. This has been a very large undertaking, requiring the analysis of many thousands of jobs, specifying such attributes as materials worked with, tools used, education and training required and physical demands of the job. The end product—The Canadian Classification and Dictionary of Occupations—is now virtually complete and because it was developed by the principal sponsors of other classifications (Census, Manpower Services and the Immigration Service) working in collaboration, there are good reasons to believe that the objective of supplying a single system has been met.

Manpower Forecasting Models

The feasibility of building a medium-term simulation model which would include a manpower requirements feature is being intensively studied with DBS, the Economic Council and the Department of Manpower and Immigration sharing in this work. The latter's policy interests are evident; in particular, the planning of training programs and of immigration policy would be greatly strengthened by the ability to forecast the manpower requirements of the economy. The Economic Council, which has responsibility for producing analysis of economic trends and assessing policy alternatives, also has a vital interest in the project. The decision is being taken to proceed with the first stage of the model. Primary reliance will be placed on the co-ordination of projects already in existence that are directly related to the model building activity.

As conceived at present, the manpower requirements would emerge as a function of the levels of industrial activity. The models would accommodate a variety of levels, reflecting the effect of policies in terms of manpower requirements. In the first stage model, the estimates of manpower requirements will probably not be used to modify or refine other components but at a later time the formal reconciliation of demand and supply could be attempted.

The intention is to provide, eventually, cross-classification by occupation as well as by industry; whether educational qualifications could also be accommodated is more doubtful though certainly this additional dimension is desired. Data limitations will be fairly severe. Of necessity, primary reliance for labour force information will be placed on the 1961 Census, with some help from current data series for updating. The possibilities offered by all current survey data will be thoroughly explored.

Capabilities under Exploration

Employment by occupation: Although operations of the manpower services will be greatly assisted by job vacancy statistics, the latter's development adds greatly to the pressure for current statistics on total occupational demand (employed plus vacancies). It is this total, not merely the fraction which shows up as vacancies, that must underlie program planning, and it is only with good data on employment by occupation that there will be a universe for the calculation of job vacancy rates. Without the rates, various problems in interpreting the vacancy data could arise.

At the present time the decennial census is the only comprehensive and detailed source of information on the occupations of the Canadian labour force³ and, with rapid change in technology, product demand and other factors which alter occupational structure, the ten-year interval is simply too long. The question of developing current data series is now under active exploration. It is hoped that either singly or in combination certain administrative data and extended utilization of the Job Vacancy Survey machinery to cover a sample of establishments could yield the desired capability but the investigations are still at a preliminary stage.

Added regional dimension: The second serious gap in Canadian manpower statistics is at the local and regional level. The Monthly Labour Force Survey, which is an approximately 1 per cent sample, reports only at the provincial level and with smaller provinces combined.⁴ For sub-provincial information, between censuses, the principal source has been the monthly survey collecting employment hours and

earnings data from all establishments (more than 40,000) with twenty or more employees. While this yields employment counts for most of the larger urban centres, the omission of employment in the small firm sector imposes some limits on usefulness. The absence of data for counties and census divisions (the main sub-provincial areal system employed by the Census) has also been a problem. However, the utility of establishment statistics will be greatly enhanced in the near future as the result of the decision to code all data, including data from small firm surveys, to the county unit.

Local area information on unemployment is regrettably weak. While rough measures are obtainable from the records of unplaced applicants registered at Canada Manpower Centres, since participation is voluntary the statistics reflect only those who choose to avail themselves of the service. Records of persons drawing unemployment insurance benefits are limited by partial coverage of the scheme. Considerable interest, therefore, attaches to an experimental investigation launched by the Econometric Research Staff in DBS to determine the feasibility of estimating unemployment by the application of multiple regression methods to data from the Labour Force Survey and the Department of Manpower. The former is so designed that sample estimates of unemployment can be tabulated for some 60 sub-provincial regions, although the estimates are judged unusable due to sampling variability and have not been produced in the past. The new plan involves using the Labour Force Survey data for all areas combined, in conjunction with the data on registrants at Canada Manpower Centres, to derive a regression equation which will provide a better estimate for a given area than the original sample figure.

Initial results appeared promising. However, difficulties were subsequently encountered in connection with inconsistencies in the reporting practices of regional offices and certain variables required by the equations ceased to be collected. These difficulties have not as yet been entirely removed. Until such time as the statistical reporting can be stabilized, further work on the estimates is in abeyance.

For some years the 1961 Census has been inadequate as a source of diagnostic information to assist the operations of the Manpower services and also as a basis for designating areas to which special federal programs would apply. Now, under the new Department of Regional Economic Expansion, comprehensive economic planning is to be an integral part of the designation program, hence a new urgency attends the development of local area statistics, including labour force.

The regional statistics program established within DBS took an important step forward in developing the capability to supply annual estimates of population for some 300 counties and census

³ The monthly Labour Force Survey supplies only ten occupation groups, hence is of very limited usefulness in this respect.

⁴ Provinces may obtain figures for individual provinces and for the larger metropolitan areas on a confidential basis, but the data are subject to sampling variability.

divisions. The method rests on the application of "symptomatic" data series—administrative data which are available annually and which bear some close relationship to total population or a specific age group. By extension of the same or similar methodology, breakdowns by age and sex will be available in the near future. However, the estimation of labour force for small areas appears more problematical due to the margin of error in the population estimates (particularly in smaller counties) and to the absence of data which could reflect a change in participation rates.

The weakness of the data base which affects most small area estimates stems from the small size and limited functions of most administrative units within provinces. Statistics, in other words, are typically generated as a by-product of programs. A

further difficulty arises with the areal system established for the manpower program, with administrative boundaries drawn to define or approximate local labour market areas. It is on this locality basis that administrative statistics are generated and for which additional labour force information would be most useful to the Department of Manpower and Immigration. On the other hand, data collected by DBS which might be utilized in producing small area estimates has been coded for counties and census divisions (the Job Vacancy Survey is the one notable exception). While a new start can be made within the 1971 Census which will supply labour force information both for Canada Manpower Centre areas and for the county system, methods for converting current data series will still be needed after the Census. It is hoped that a system of geo-coding now being developed will supply the solution.

and Annual 1970.

Canadian Statistical Review

Cette revue est disponible en édition française. Revue Statistique du Canada, n° du catalogue 11-003F.

Series published in this Review are stored in CANSIM, the computerized time series data bank of the Dominion Bureau of Statistics. All or any part of the data bank contents may be purchased on magnetic tape or as computer printouts. For additional information, see inside back cover.

Selected Economic Indicators appearing in the Section I are published in seasonally adjusted form. Seasonally adjusted data are most useful for analysis and forecasting as they bring out the underlying trends of economic time series. Seasonal adjustments remove the effect of repetitive intra-year variations resulting from normal differences in weather, holidays with invariable dates, or other events which repeat with the same timing. Additional adjustments may be necessary for series which contain variation due to the difference in working or trading-days in each month or for holidays or other events with variable dates. Such adjustments are made prior to the seasonal adjustment but are treated as part of the seasonal adjustment.

The seasonal adjustment method applied to economic time series at the Dominion Bureau of Statistics is a computerized ratio-to-moving average method. The standard computer program used in the Bureau is the US Bureau of the Census Method II, X-11 version.

The *MCD*, or *Months for Cyclical Dominance*, in a table containing seasonally adjusted series indicates the smallest span of months for which the average change in the cyclical factor is greater than that in the irregular factor. For the smoothest series the MCD is 1, for the most erratic series it is 6. Applying moving average of the period equal to the MCD tends to smooth irregular movements which may obscure the underlying trend-cycle.

Smoothed data have been used for the graphs of some of the seasonally adjusted series with MCD of 4, 5 or 6. A 5-term moving average was applied for smoothing these series.

* * * * *

A weekly supplement containing data published between release dates of this review is distributed free of charge to all subscribers. Historical data for *Selected Economic Indicators*, both unadjusted and adjusted for seasonal variation, are distributed to subscribers in an Annual Supplement.

NOTE TO USERS

Changes occur from time to time in tables contained in this Review to reflect newly available economic series, changes made in concept, composition, comparability, seasonal adjustment methods, benchmark data, etc. Changes in this issue are as follows:

Section 3, Tables 1.1-1.9—National Income and Expenditure Accounts

This issue of the Review incorporates (1) revisions to exports and imports of goods and services for 1968-1970 based on data in *Quarterly Estimates of the Canadian Balance of International Payments, Third Quarter 1970*, DBS Catalogue No. 67-001 and advance information for the Fourth Quarter 1970 given in the *DBS Daily Bulletin* of February 16, 1971; and (2) revisions to gross fixed capital formation for 1969-70 based on preliminary direct survey information.

Section 3, Tables 2.1 and 2.2—Real Domestic Product

Complete revisions for the Index of Industrial Production table will be published in the April issue of this Review. Revisions for 1970 only were published in the March 19, 1971 edition of the Weekly Supplement to this Review.

Revised *Indexes of Real Domestic Product by Industry of Origin* (including special component industry aggregates such as Index of Industrial Production) on a 1961 weight and reference base, for the years 1961-69 are available on request from the DBS Publication Distribution, Catalogue No. 61-510, Occasional. For 1970 revisions, see DBS Catalogue No. 61-005. These publications incorporate the latest annual and quinquennial census levels, the final 1961 industry weights, revised seasonal adjustment, new monthly indicators and revised methodology.

Section 4, Table 3.1—Financial Flows Matrix

The National Income and Expenditure Accounts revisions result in some conceptional and statistical changes to the Financial Flows Accounts. Revised data for the Financial Flows Accounts are not comparable with those of earlier periods which do not reflect these changes. For details of these revisions see *National Income and Expenditure Accounts, 1926-1968*, Catalogue No. 13-531. Financial Flow Matrices in this issue reflect the revisions of the National Income and Expenditure Accounts for 1968 and 1969 and the first to third quarters 1970.

A new publication of the historical quarterly series for all sector and category tables, and annual matrices covering the first quarter 1962 onwards, is expected to be released in 1971.

Data for the third quarter 1970 are published in the present issue of the Review. Supplementary tables covering revisions for the third quarter 1969, nine months ended September 30th, 1969 and nine months ended September 30th, 1970, appear on pages 114-119 of this issue.

Section 3, Tables 4.1-4.3—Balance of International Payments

These tables contain revised data for the years 1969 and 1970.

Section 4, Tables 3-9—Labour Force

The seasonally adjusted Labour Force series have been revised to reflect the incorporation of 1970 data. The revised data were prepared using the *X-11 Variant of the Census Method II* computer program, an improved version of the formerly used X-9 version. Only minor changes resulted from this change in programs. The unadjusted data are unchanged.

Section 8, Table 1—Building Permits, by Type

Seasonally adjusted data for this table have been revised from 1965 to date.

Section 13, Table 7—Payments on Death Claims

This table has been discontinued because only annual data are now available from the data source.

Section 13, Table 9—Index Numbers of Security Prices

The Index Numbers of Security Prices in this table, and in Section 1, Table 10, have been arithmetically converted to a 1961 = 100 base.

GNP rose 7.5 per cent at current prices and 3.3 per cent in real terms in 1970. The rates were 10.0 and 5.1 per cent in 1969.

A surge in exports in 1970 together with a moderate rise in imports resulted in record 1970 surpluses on transactions with non-residents.

The pace of spending moderated in 1970. Net exports, government purchases, and fixed capital formation (ex housing) accelerated, but other demand categories increased at a slower rate or declined.

GNE increased by \$1.39 billion in the fourth quarter of 1970. The gain in net exports of goods and services was the major factor contributing to the expansion.

ANNUAL CHANGES IN GNE AND COMPONENTS

QUARTERLY CHANGES IN GNE AND COMPONENTS

ALL DATA SEASONALLY ADJUSTED AT ANNUAL RATES.

NATIONAL INCOME AND EXPENDITURE ACCOUNTS, PRELIMINARY FOURTH QUARTER AND ANNUAL 1970

Gross National Product

Preliminary fourth quarter 1970 estimates of the National Income and Expenditure Accounts and revised estimates for the earlier quarters indicate continued expansion in 1970. In real terms, the gain in the final quarter of the year was particularly strong.

The aggregate value of Canada's production of goods and services rose by 7.5 per cent in 1970, to reach a level of \$84.5 billion. This rate of increase is somewhat lower than those witnessed in most recent years, except in 1967 when the economy also experienced some slowing down. The rise in the implicit price deflator for GNP of 4.1 per cent, though smaller than the 4.7 per cent rise in 1969, was still one of the largest annual price increases recorded in recent years. However, most of the annual increase was attributable to the momentum of rising prices at the beginning of the year. In the course of the year there was some deceleration. After allowing for rising prices, the physical volume of production rose by 3.3 per cent. This compares with increases of 3.5 per cent in 1967 and of around 5.0 per cent in 1968 and in 1969.

Fiscal and monetary policies adopted in 1969 apparently played some role in slowing down the growth of incomes and domestic demand in the first half of the year and at the same time contributed to the moderation of price advance. Some easing of these policies appear to have had an effect in the recovery of demand in the latter part of 1970. The quickened pace of activity in the fourth quarter was noteworthy, especially in view of the fact that it occurred despite a major strike in the automobile industry through most of that period. A remarkable development in 1970 which contributed to the continued growth of the economy was the spectacular gain in exports realized in the first quarter and maintained through the remainder of the year.

Prices showed a progressive deceleration as the year wore on. However, despite some indications of moderate productivity gains, there was no comparable evidence of a parallel decrease in cost pressure. The sharp decline in corporation profits reflected these underlying cost-price relationships as well as certain special factors, in particular numerous work stoppages and the effect on some export-oriented industries of the appreciation of the Canadian dollar, which resulted from the freeing of the exchange rate in the month of June. Employment increases were unusually small and insufficient to absorb the rapid rise in the labour force. As a result, the unemployment rate for the year jumped from 4.7 per cent to 5.9 per cent—its highest level since 1962.

Consumer spending continued to be an important element in explaining cyclical changes in aggregate demand. Personal expenditure on consumer goods

and services rose by 5.3 per cent, compared with increases of between 8.0 per cent and 10.0 per cent in the previous few years. Not unexpectedly, the principal weakness occurred in the purchases of the more expensive durable goods items, where the consumer has the greatest scope for discretionary spending. Outlays on new passenger cars fell by 17.0 per cent. A steep decline in this component occurred in the first quarter; after recovering ground in the following two quarters, spending fell again in the fourth quarter, when sales were affected by the automobile strike. Among other durable goods, recreation equipment and home appliances also declined. Non-durables maintained a similar rate of advance as last year, while semi-durables, especially clothing and footwear, and services showed notable decelerations. The slowdown in the services category was related to the further extension of the medicare program which has the effect of shifting most medical expenses from the personal to the government sector.

High levels of mortgage interest rates in 1969 and early 1970 had an influence on investment outlays for new housing. New residential construction fell by 8.0 per cent in the year. Starts of new residential structures fell abruptly in March 1969 and continued to slide down until May 1970. This was reflected, with a usual time lag, in strongly declining outlays in the latter part of 1969 and in the first two quarters of 1970. In response to the easing in mortgage markets since mid-year, and to the injection of federal mortgage funds for direct lending in low rental housing, especially in the fourth quarter, starts climbed sharply from July onward. This rebound in starts showed up in a very sharp 12.7 per cent advance in outlays in the closing quarter.

Business fixed investment excluding housing rose by 8.0 per cent to a level of \$11,172 million. These latest results, which are based on preliminary annual survey information, reveal a much better performance than could have been inferred from a reading of the quarterly estimates published earlier in the year. The indicators normally used in the preliminary estimation of quarterly spending did not capture in 1970 the strength of business spending on plant and equipment. Despite falling profits and sluggish sales in domestic markets, the current results are much closer to the expressed intentions declared at the beginning of the year in the survey of business investment. Spending on non-residential construction was up by 10.1 per cent versus 5.1 per cent last year. Outlays on machinery and equipment rose at a lesser rate than last year—by 6.2 per cent compared with 11.1 per cent.

The bulk of the sharp decline in inventory investment was attributable to the farm component, which swung from an accumulation of \$503 million

to a decumulation of \$178 million. The farm inventory movement reflected a sharp reduction in the value of the new crop, partly in response to the government "Lower Inventory for Tomorrow" program; it also reflected considerable declines in grain stocks in commercial channels, coinciding with rising grain exports. Investment in non-farm business inventories also declined somewhat. This was largely due to sharp depletions in the fourth quarter, especially in the stocks of motor vehicle dealers which were drawn down as a result of the automobile strike.

Strong foreign demand for Canadian goods and services provided by far the greatest stimulus to the economy. The gains were concentrated in the first quarter, when they accounted for practically all of the increase in total demand. Exports were thereafter maintained at only slightly lower levels than in the first quarter, resulting in a gain of 13.5 per cent for the year as a whole compared with 10.5 per cent in 1969. In merchandise exports, increases were widespread but particularly notable in metals and in cereals. An unusual feature of this expansion was the altered direction of the flow of export gains. Exports to the United States, Canada's largest customer, increased very moderately, in line with the marked economic slowdown in that country, whereas exports to overseas countries, especially to the European Economic Community, to the United Kingdom and to Japan rose spectacularly. In sharp contrast with exports, imports of goods and services rose by only 2.0 per cent. These developments in the external sector caused a huge swing of \$2.1 billion in the balance on transactions in goods and services with non-residents, from a deficit of \$967 million to a surplus of \$1,136 million—the highest surplus ever recorded in Canada.

Rising government current expenditure on goods and services was another important sustaining force. This year's rise of 15.5 per cent was the highest since 1966. Almost half of the gain occurred at the provincial level of government, up 37.0 per cent, largely due to increased expenditures under medicare programs. Expenditure of local governments and of hospitals also recorded sizable increases of over 10.0 per cent. Federal government current expenditure on goods and services rose by 5.1 per cent.

On the income side, wages, salaries and supplementary labour income made a substantial gain of 8.9 per cent. Though this increase was smaller than those recorded in recent years (when annual increases generally exceeded 10.0 per cent), it was nevertheless well ahead of the increase of 7.5 per cent in GNP. Higher average earnings accounted for most of the increase in labour income. With most of the increase in employment absorbed by service-producing industries, there was an accentuation of the tendency towards faster increases in this group than in goods-producing industries. Preliminary estimates of corporation profits show a decline of 6.2 per cent. Accrued net farm income fell by almost 20.0 per cent in 1970, mostly due to

the lower crop. (Swings of this magnitude are not uncommon in this series.) Personal disposable income rose at a slower pace than in any year since 1961, but because personal expenditure was even more sluggish, the personal saving ratio (personal saving as a proportion of personal disposable income) increased in 1970.

Price Movements

For the year 1970 as a whole, the implicit price index for gross national expenditure rose by 4.1 per cent compared with a 4.7 per cent rise in 1969. While conceptually different, base-weighted price indexes such as the Consumer Price Index, the Industry Selling Price Indexes and the General Wholesale Price Index, also showed price moderation this year. The price indexes for most major categories of final expenditure recorded lower increases than last year. Within 1970, the overall implicit price index decelerated, mainly as a result of the moderation from the second quarter onward of the rise in the implicit price index for personal expenditure on goods and of that for exports.

The implicit price index for exports rose by 3.3 per cent. The increase was concentrated in the first quarter, which showed an unusually strong 2.1 per cent rise. Export prices rose very little in the rest of the year. The effect on export prices of the freeing of the exchange rate in June 1970 is not yet clear. It would appear that for many export commodities where prices are determined in world markets or contractually fixed in United States dollars it caused a lowering of the Canadian prices. The impact of the appreciation of the Canadian dollar on import prices was, as expected, to ease their rate of increase.

The implicit price index for total personal expenditure rose by 3.2 per cent—a deceleration from the increases of about 4.0 per cent recorded in each of the previous two years. All components except durables decelerated. A marked easing in the price of rents explains the slowdown in services, as most other items in the services group continued to rise strongly. The softening in non-durables was due to declining food prices. The decline in these prices, which was one of the more striking developments of the year, was related to depressed markets for certain agricultural products, to lower prices of food imports, and, in the latter part of the year, to intense competition among large retail chain stores. The rise in durable goods prices was centered on the first quarter.

The increase of 3.0 per cent shown by the implicit price index for business gross fixed capital formation was notably lower than that of 4.6 per cent shown in 1969. The deceleration occurred in construction prices. The implicit price index for residential construction rose by 3.3 per cent; that for non-residential construction by 4.2 per cent. This compares with increases in 1969 of 5.2 per cent and 6.3 per cent respectively. The rise in the price of

LABOUR FORCE (More detail in Section 4, Table 3)

TOTAL LABOUR FORCE AND TOTAL EMPLOYED INCREASED IN THE MONTH OF JANUARY WHEREAS TOTAL UNEMPLOYED DECLINED. THE UNEMPLOYMENT RATE FELL FROM 6.6 IN DECEMBER TO 6.2 IN JANUARY.

¹The occupational status of the majority of the persons destined to the labour force is determined by immigration officials by an examination of documentary evidence provided by the immigrants. The classification of occupations is similar to that used in the 1961 Census; see Occupational Classification Manual, Census of Canada, 1961, Catalogue Number 12-506. ²Includes logging, fishing, trapping and hunting. ³Includes mechanical and construction. ⁴Includes a small number in non-specified occupations. ⁵Does not include students entering Canada on students' visas. ⁶Includes also retired persons, elderly dependents, fiancés or fiancées and other unspecified persons not intending to enter the labour force. Source: Quarterly Bulletin, Department of Manpower and Immigration.

¹Excludes profits of government business enterprises. ²Includes the withholding tax applicable to this item. ³Includes profits (net of losses) of government business enterprises and other government investment income. ⁴Includes value of physical change in farm inventories. The seasonally adjusted data includes an arbitrary smoothing of crop production and standard seasonal adjustment for withdrawals of grain from farm stocks and the change in other farm-held inventories. Because of the arbitrary element, too precise an interpretation should not be given the seasonally adjusted figures. ⁵Includes net income of independent professional practitioners. ⁶See footnote 4, Table 1.2.

¹Includes defence expenditures. ²Includes outlay on new durable assets such as building and highway construction by governments, other than government business enterprises. Excludes defence construction and equipment which are defined as current expenditure. ³Includes capital expenditures by private and government business enterprises, private non-commercial institutions and outlays on new residential construction by individuals. Capital expenditure is defined to include all transfer costs on the sales and purchases of the existing land and buildings. ⁴The book value of inventories is deflated to remove the effect of price changes and the derived "physical" change is then valued at average prices of the current period to obtain the value of physical change. The difference between this value of physical change and the change in book value is called the inventory valuation adjustment. (as shown in Table 1.1) ⁵See footnote 4, Table 1.1

¹The implicit price deflators of the seasonally unadjusted components of Gross National Expenditure, derived by dividing the value figures in current dollars by the constant dollar figures, are not suitable as indicators of quarter-to-quarter price change. This is because they are currently weighted and therefore are affected by compositional shifts which occur within the unadjusted components of Gross National Expenditure, on a quarter-to-quarter basis. Quarter-to-quarter movements in the implicit price deflators based on seasonally adjusted data are less subject to the problem of shifting weights and may be used as a measure of price change.

¹Includes the newly imposed taxes on life insurance companies. At the present time, for National Accounts purposes, life insurance companies are treated as associations of individuals in so far as their investment activities are concerned. The new taxes are thus included here pending a complete review of the treatment of insurance.

²Excludes the refundable tax on corporate cash profits introduced May 1966. Refunding of the tax began in the third quarter 1968.

³Withholding taxes. ⁴The quarterly figures of real property taxes unadjusted and seasonally adjusted are obtained by dividing annual totals by four since real property tax rates have been generally upward, this treatment gives rise to a fictitious seasonal between the fourth and first quarters in the seasonally adjusted taxes of series.

¹These implicit indexes are currently weighted price indexes. They reflect not only pure price changes, but also changing expenditure patterns within and between major groups. Quarter-to-quarter comparisons based on the seasonally adjusted Data are less subject to the problem of shifting weights than are similar comparisons based on data unadjusted for seasonality, and therefore may be used as indicators of price change.

Table 1.9: relation between gross national product at market prices and gross domestic product at factor cost, (million dollars)

¹A minus sign except for official monetary movements, indicates an outflow of capital from Canada. ²Includes guaranteed issues. ³Bank balances and other short-term funds abroad (excluding official reserves). ⁴Includes changes in loans and accounts receivable and payable, and also balancing item representing difference between direct measurements of current and capital accounts. ⁵Canada's Special Drawing Rights are shown for the first quarter 1970. SDR's were issued January 1, 1970 by the International Monetary Fund (IMF) to member countries participating in the agreement.

¹Excludes inmates of institutions, members of the armed services, Indians living on reserves and residents of the Yukon and Northwest Territories. The estimates are derived from a sample survey and are subject to sampling error. In general, the smaller the estimate, the larger is the relative sampling error. ²The labour force as a percentage of the population 14 years of age and over. ³The unemployed as a percentage of the labour force. ¹See footnote 1, table 3. Labour force obtained as the sum of employed and unemployed from tables 5 and 7. ²Canada totals, obtained by summing the seasonally adjusted data for the five regions, are usually different from the totals given on page 7. The small differences result from the seasonal adjustment of the Canada and regional data having been carried out independently of each other. Source: The Labour Force, (71-001) D. B. S.

¹In calculating time loss, only the workers directly affected by the strike or lockout are taken into account; time lost by workers indirectly affected, such as those laid off as a result of a work stoppage is not included. ²The statistics for individual industries exclude strikes and lockouts involving fewer than 100 workers; the total, however, includes all work stoppages. ³The agricultural, finance, insurance and real estate and public administration and defence industries are not shown separately; should strikes occur in these industries, they also will be shown in the total. ⁴Includes miscellaneous manufacturing industries. ⁵Includes also publishing and allied industries. ⁶Includes also the storage and communication industries.

¹The data in Tables 12 to 19 are based on reports from firms employing 20 persons or more in any month of the year and relate to the last pay periods in the month. Greater industrial and area detail and more explanatory notes are given in the source publication named below. ²Excludes agriculture, fishing, trapping and public administration and defence. ³Includes storage, electric power, gas and water utilities. ⁴Excludes domestic service. ¹Total commodities and services does not add up to 100 per cent; the portion of shelter which includes taxes and mortgage interest, and amounts to 8 per cent, is excluded. ²These indexes measure within each city the percentage change in consumer prices from the base period to the subsequent time periods. They cannot be used to compare levels of prices between cities. Information on inter-city retail price differentials is contained in technical note No 6 published in the June 1969 issue of the Canadian statistical review.

¹Monthly shipments represent an estimated projection of the latest available Census of Manufacturers values except for those industries whose long-term contracts result in large intermittent shipments; for these a monthly estimate of work put in place has been substituted. ²Total manufacturing inventory owned by manufacturers including warehouse stocks. ³Total new orders received during the period at estimated selling value, net of cancellations, regardless of whether the orders will be filled from stock or as a result of activity during the same month. ⁴Annual figures for inventories and unfilled orders are end of December values.

Source: Inventories, Shipments and Orders in Manufacturing Industries (31-001), D.B.S.

Table 2: manufacturing shipments¹ by industry based on the 1960 standard industrial classification (million dollars)

| monthly averages or months | | total shipments | non- durables | durables | foods and beverages | tobacco products | rubber | leather | textile | knitting mills | clothing | wood |

¹Monthly shipments represent an estimated projection of the latest available Census of Manufacturer's values except for those industries whose long term contracts result in large intermittent shipments; for these a monthly estimate of work put in place has been estimated. Source: Inventories, Shipments and Orders in Manufacturing Industries (31-001), D.B.S.

¹Prior to January 1969 shoe classifications were different from those now in use. The change was undertaken in order to eliminate ambiguity. The discontinuity is virtually insignificant except perhaps in two classifications, i.e. girls' under size 4 and infants' and "little children's". Source: Footwear Statistics (33-002), D. B. S.

¹Total pulp production covers "screenings" which are already included in exports. "Screenings" are excluded throughout from mechanical and chemical pulp. ²100 cu. ft. of solid wood; pulpwood produced for domestic use and excluding exports, but including receipts of purchased roundwood. ³Customs exports. ⁴Mill shipments destined for export. Sources: Pulpwood and Wood Residue Statistics (25-001), Trade of Canada, Exports (65-004), D.B.S.; Bulletins of Canadian Pulp and Paper Association and Newsprint Association of Canada.

¹Data compiled according to the Steel Distribution Index revised January, 1964. Figures on net shipments relate to rolled steels products only. Shipments to consuming industries of castings, forgings and steel pipe are not included. ²Includes building contractors, public and utility construction, structural steel fabricators, national defence and public works and utilities. ³Includes appliances and utensils. Note: Some groupings are not entirely comparable to year 1964 due to change in classifications but in general the differences are minimal. ⁴Excluding shipments for re-processing of maker's own plant. ⁵Data on shipments of steel shapes to consuming industries are not available for this period (August 69 to November 69) due to the effect of strikes in this industry. ¹Production plus imports less re-exports, minus exports. ²Commencing January 1967, the value of new motor vehicles sold in Canada (as reported by manufacturers and distributors) was based on "actual cost to purchaser" rather than the suggested list price as in the past. Sources: Motor Vehicle Shipments (42-002), New Motor Vehicle Sales (63-007), Trade of Canada, Imports (65-007), Exports (65-004), D. B. S.

Note: Components may not add to totals due to rounding. Current figures in this table are preliminary and therefore subject to revision. ¹Includes crude oil, condensate and pentones plus. ²Deliveries to refineries and exports do not add to total new supply due to losses, other uses and inventory changes. ³Gross new production by field less field flared and waste. ⁴By gas utilities, does not include imports. Sources: Crude Petroleum and Natural Gas Production (26-006), Gas Utilities (55-002), D. B. S.

¹Barrels of 35 Canadian gallons. ²Includes domestic and imported crude oil, condensate and pentanes plus received by Canadian refineries. ³Refinery production (from crude oil, condensate and pentanes plus, and commingled propane/butane mixes) plus other materials used. ⁴Includes deliveries of butane commingled in the crude stream in Saskatchewan and Alberta. ⁵Includes inventories at end of period being held at gas plants and in storage caverns. ⁶Includes stove oil, kerosene and tractor fuel. ⁷Includes aviation gasoline and aviation turbo fuel. ⁸Due to conceptual changes, the stock and sales series are not available on a comparable basis prior to June 1965. Includes propane and propane mixes and butane and butane mixes. ⁹Includes petro-chemical feed stocks, naphtha specialties, coke, lubricating oil and grease, still gas and other products.

Source: Refined Petroleum Products (45-004), D. B. S.

¹The coverage was extended to 507 municipalities in 1948, and as of 1965, stands at more than 1,400; minor revisions are still being required in the table, due to the non-receipt of returns from a few small places. No account is taken of the building activity outside of registration areas. Actual operations normally follow the granting of permits but a number of projects are not undertaken or abandoned. The amount depends upon the statement of the applicant and considerable change may develop before the completion of the operation. Source: Building Permits (64-001), D. B. S.

¹A dwelling unit is defined as a structurally separate set of living quarters having its own entrance from outside of the building, or from a common passage inside. These data are the result of a nation-wide survey, for which the field work is carried out by the Central Mortgage and Housing Corporation. All metropolitan areas and urban centres with a population of 10,000 or more, along with certain other areas of high building activity, are enumerated completely each month. The remainder of the country is covered on a sample basis quarterly. ²End of period. Source: New Residential Construction (64-002), D. B. S.
